[00:00:05] Del Bigtree
Did you notice that this show doesn't have any commercials? I'm not selling you diapers or vitamins or smoothies or gasoline. That's because I don't want corporate sponsors telling us what to investigate and what to say. Instead, you're our sponsors. This is a production by our non profit, the Informed Consent Action Network. If you want more investigations, more hard hitting news, if you want the truth, go to ICANdecide.org and donate now.

[00:00:49] Del Bigtree
Good morning. Good afternoon. Good evening. Wherever you are out there in the world, it's time for us all to step out onto the Highwire. It's amazing what a difference a year makes. When we start to look back at some of the things that happened and how the language around all of these conversations about Covid, about pandemics, about vaccines, about lockdowns, it all seems to be shifting. It feels like the world is waking up. And a lot of people that were awake but weren't admitting it are now saying, yep, I was always awake. This week a lot of attention has been brought to Ice Cube. If you remember back in 2021, he was fired off a set. This was what the the tweet said. "Ice Cube will no longer star in 'Oh, Hell no' A perfect title, actually, for this "for Sony after declining a request from producers to get the Covid 19 vaccine, he was set to be paid $9 Million." Now the headlines are talking about how he's basically bragging. "Ice Cube seems pretty proud about losing $9 Million because he wouldn't get vaccinated." Tucker Carlson recently caught up with him and had a very interesting interview. Take a look at this.

[00:01:53] Tucker Carlson, News Correspondent
Why wouldn't you take the VAX? You had a direct order to take it. You were told to take it.

[00:02:00] Ice Cube, Rapper, Actor
Yeah. I'm not real good with direct orders, but on a whole nother note, it wasn't ready. You know, it it was, it was six months, you know, kind of rush job, and and I didn't feel safe.

[00:02:19] Tucker Carlson, News Correspondent
But they told you you were safe.

[00:02:22] Ice Cube, Rapper, Actor
I know what they said. I know what they said. And I heard him. I heard him loud and clear. But it's it's not their decision. There's no repercussions if they're wrong. But I get all the repercussions if they're wrong.
[00:02:38] Tucker Carlson, News Correspondent
Was it a tough call for you?

[00:02:39] Ice Cube, Rapper, Actor
No, it wasn't a tough call. You know, I wanted it to be an example for my kids, you know, really make sure they ain't going to take it either. Show them that I you know, I want to stand on my convictions and that I was willing, you know, to lose $9 Million and more because we probably lost more, you know, since then.

[00:03:01] Tucker Carlson, News Correspondent
The idea is that people who stand on their convictions are heroes. They're brave. They have principles. You know, they're the people we look to for inspiration. But in this case, with this decision and these principles, you were not hailed as a hero.

[00:03:18] Ice Cube, Rapper, Actor
No.

[00:03:20] Tucker Carlson, News Correspondent
You were attacked.

[00:03:22] Andy Cohen, American Television Presenter
Why won't you get the vaccine, man? Hey, look, man, I just rather be myself than take that vaccine like you other 3 billion bozos.

[00:03:31] Ice Cube, Rapper, Actor
I've never told anyone not to get vaccinated publicly. That was never my message to the world. I didn't even want people to know whether I got vaccinated or not.

[00:03:44] Tucker Carlson, News Correspondent
Do you know anyone who was injured by the vaccine?

[00:03:46] Ice Cube, Rapper, Actor
I do. And they suffer every day. And it's. It's hard to watch. Sometimes you got to let people know what's going on so you can actually move the needle. Choose to be vocal if it's true. Why can't I say it?

[00:04:03] Tucker Carlson, News Correspondent
Well, you can't say it because it is true.

[00:04:06] Ice Cube, Rapper, Actor
There it is. Now, that's the problem with the world today. Thinking something is not a crime, saying it is not a crime. You know what I mean? So I just tell what's real, you know, If the truth hurts, say ouch.

[00:04:22] Del Bigtree
Well, there it is, speaking truth to power, as he has most of his career and really coming out now. Apparently, he's even gotten some trouble with his new basketball league and he's speaking out about it. "Ice Cube goes off on the NBA, mainstream media and gatekeepers for trying to sabotage his brand, the Big Three, because he isn't a part of their club. I'm going on an F. the Gatekeepers podcast tour to get the message out to the people." Hey, maybe we'll get lucky. Ice Cube, why don't you drop in studio here on that tour? And we'd love to have a conversation because we've been calling you a hero all the way through. That's what the Highwire does. Got a huge show coming up. Another big hero a little bit later on in the show. Edward Dowd. I don't know about you, but it just feels like there's this new wave of strokes and heart attacks and blood clots is the leading cause of death. Now, suddenly, we're going to get into all of those details. Is it really on the rise? But first, it's time for the Jaxen report. We've been featuring comedians and now musicians, all all these people from Hollywood that seem to be toeing the line for a long time. They're breaking ranks. It's an amazing moment.

[00:05:39] Jefferey Jaxen
It's an incredible moment. And speaking of Hollywood, there's a hot new drug out there and it's an injectable drug. It's not a Covid vaccine. It's a diabetes medication vaccine. It's a weight loss drug. It's something. But a lot of people are clamoring for this thing. Take a look.

[00:05:56] Del Bigtree
Alright.

[00:05:57] Dr. Jennifer Ashton, ABC News Chief Medical Correspondent
The hottest drugs in the country right now.

[00:06:00] Female News Correspondent
The medication has taken Hollywood by storm.

[00:06:03] Female News Correspondent
It's the talk of TikTok.

[00:06:05] Female News Correspondent
I just start dropping pounds left and right.
Female News Correspondent
The topic, Ozempic has over 300 million views.

Andy Cohen, American Television Presenter
People looking to lose weight have a new tool in their arsenal.

Female News Correspondent
Baby, the hype is real.

Andy Cohen, American Television Presenter
Prescription drugs called semaglutide that come in a now unmistakable pen Ozempic and Wegovy. The brand names for Semaglutide drugs that were developed to help people with Type two diabetes.

Dr. Jennifer Ashton, ABC News Chief Medical Correspondent
They've been out for a long time for people with type two diabetes. Now some of them have FDA approval for treating obesity. They're incredibly effective for weight loss.

Andy Cohen, American Television Presenter
Ozempic works. They make you feel full. They raise insulin levels, they decrease gastric emptying, and they do work.

Female News Correspondent
The weight just started falling off.

Female News Correspondent
I had been on the Semaglutide for a total of ten weeks now.

Female News Correspondent
After 20 weeks, I am down 68 pounds.

Andy Cohen, American Television Presenter
Big names like Elon Musk, Amy Schumer and Chelsea Handler have admitted taking it. And from celebrities to social media influencers, this trend has taken the weight loss world by storm.

Andy Cohen, American Television Presenter
Yolo. You look thin.

Delores Catania, Real Housewives of New Jersey
Thank you.

Andy Cohen, American Television Presenter
Ozempic?

Delores Catania, Real Housewives of New Jersey
Yep.

Andy Cohen, American Television Presenter
What housewife isn't on Ozempic?

Delores Catania, Real Housewives of New Jersey
Not one.

Andy Cohen, American Television Presenter
Any side effects?

Delores Catania, Real Housewives of New Jersey
No.

Andy Cohen, American Television Presenter
Really?

Female News Correspondent
Just not hungry.

Andy Cohen, American Television Presenter
Okay.

Male News Correspondent
Is it safe? Yes. It's considered to be generally safe.

Female News Correspondent
Very rare side effects of pancreatitis.
[00:07:24] Female News Correspondent
How much are you expecting this drug to increase demand? Or how much demand for this drug are you expecting to be increased in the next 5 to 10 years?

[00:07:32] Lars Fruegaard Jorgensen, Novo Nordisk CEO
We expect this will be a very, very significant part of our business. We are just getting going. So it's a very, very sizable market.

[00:07:42] Del Bigtree
This is a gigantic market. Obviously, weight loss drugs have always been one of the leading contenders, especially in a nation like America that is struggling with obesity on such a major level and diabetes and all those things. So this certainly has played into that. And it does appear that almost everybody is taking this thing right now. I hear reports my hair salon is offering Ozempic, as he called it, and certainly clinics. And it just it just seems like it's everywhere and everyone's down.

[00:08:13] Jefferey Jaxen
There's commercials everywhere for this thing. And you mentioned all those people that woke up during Covid to the realities of how pharmaceutical companies operate, how messaging works. Let's take those people along a ride of what we do here and we dig deeper into these drugs. So the first really red flag is that pharmaceutical execs saying it's a sizable market. Any time there's this much hype around a drug, this much marketing, this much push, this possibility for this much money to be made, we have to pump the brakes. Have some caution here. And let's look at some realities. Have a black and white conversation about this thing and let's look through the hype. So in 2021, when we were focused on the pandemic, everyone was focused on the pandemic. This was the headline that came out. "FDA Approves New Drug Treatment for Chronic Weight Loss Management First since 2014." They've been working on these for a long time. And then, sure enough, the American Academy of Pediatrics, these make kind of the rules for for children in the United States. They came out and jumped right on board of the bandwagon. So you just saw all the Hollywood hype. They have the adults. It's at hair salons. It's your doctors. Give them out like candy. What about the kids? American Academy of Pediatrics said we got you covered. Here's the headline here.

[00:09:20] Jefferey Jaxen
"Consider drugs and surgery early for obesity and kids. New guidelines say waiting doesn't work." And it says "children struggle with obesity. Struggling with obesity should be evaluated and treated early and aggressively, including with medications for kids as young as 12," aggressively with medications. Again, here's another red flag. "We're treating kids aggressively, as young as 12 with medications that just were recently approved off label with an injectable diabetes drug." Third, red flag. We have Boris Johnson, obviously someone that was at the lead of the Covid pandemic response in the U.K. He steps down, goes directly into writing op eds. And what does he do for his first op ed? Does he talk about his experience with the Covid response? No. He pushes this drug. "The wonder drug I hoped would stop my 1130 fridge raids for cheddar and chorizo didn't work for me." And you start reading this article and it sounds like it was written by a pharmaceutical rep. Listen to this. "It's a cinch, said the doctor. All you need to do is inject a tiny dose of clear ozempic fluid into your abdomen once a week and hey presto, no more raiding the fridge at 1130 for cheddar and chorizo washed down with a half a bottle of wine." It's a dark life you got there, Boris. I don't think an injection is going to help on that one.

[00:10:32] Jefferey Jaxen
But now we start uncovering the story. So this thing has been out a couple of years. It's all the rage. But then you start seeing headlines like this and we're no stranger to these type of headlines. "Is Ozempic causing a wave of Suicidal Americans? FDA has received 60 reports of side effects, and drugmaker Novo Nordisk says it's taking the issue very seriously amid fears of 5 million people taking the shot." We go to Ozempic package insert. It's required we know these with vaccines. It's required for every drug and injectable product. Talk about everything, including harms and adverse events. You can look on this product everywhere and you see nothing about the word suicidal ideation, suicidal attempts, suicidal, anything. So we got a problem. We're giving this thing out in mass quantities. We have a large marketing campaign and we have a side effect that is obviously a really big deal that no one, no one's really talking about. We're just starting to see it in the headlines. This is Reuters. Not only is the FDA looking at this, but the European Union is looking at this as well. "EU Investigates Ozempic Weight loss drug Saxenda after suicidal thoughts reported." There's a lot of brand names of these drugs, so just try to follow me on that. It says, "Although Iceland's regulator has flagged only three cases, the issue of suicidal thoughts linked to weight loss drugs is sensitive and has hobbled previous attempts by the drug industry to to develop lucrative weight loss drugs." So we have a history now, and it says here "in clinical trials for Ozempic and Saxenda Novo excluded people with a history of psychiatric disorders or recent suicidal behavior." So Del they stack the deck in the pre-licensure trials where we saw that? Where have we seen this before?

[00:12:08] Del Bigtree
Yeah. And it's almost like they knew there might be an issue.

[00:12:12] Jefferey Jaxen
Yeah, exactly. And so we go on and it says here, "Sanofi's accompil" in the article at Reuters, "which never won US approval, was withdrawn in Europe after in 2008 after being linked to suicidal thoughts." So we have drugs being withdrawn. Exactly. Weight loss drugs being withdrawn because of suicidal thoughts. So, there's a lot of breadcrumbs here to follow. So I started digging even more. And we see this study, we have a systemic review of this is the "post-marketing withdrawal of anti obesity medical products because of adverse drug reactions." We go into this study and we see this written. "We, the authors, identified 25 anti-obesity medications withdrawn between 1964 and 2009." Did you know there were that many? I didn't.

[00:12:56] Del Bigtree
No
"23 of these were centrally acting via monoamine neurotransmitters. Case reports were cited as evidence for withdrawal in 80% of instances." Here we go. "Psychiatric disturbances, cardiotoxicity mainly attributed to reuptake inhibitors and drug abuse or dependence mainly attributed to neurotransmitter releasing agents, together accounted for 83% of the withdrawals," and the conclusion the authors gave was this "Most of the drugs that affect monoamine neurotransmitters licensed for the treatment of obesity over the past 65 years have been withdrawn because of adverse reactions. The reason for withdrawal raised concerns about the wisdom of using pharmacological agents that target monoamine neurotransmitters and managing obesity." So Del guess what Ozempic and Wegovy all of these drugs flooding the market are? They are the same monoamine transmitters. They're acting on the same parts of the brain. And if you go to the Mayo Clinic, they actually do have the warnings. So all of these drug brand names are the drug is semaglutide. And so you go to the Mayo Clinic and you look under Semaglutide and you see this. "This medicine may cause some people to be agitated, irritable or display other abnormal behaviors and may also cause some people to have suicidal thoughts or tendencies or to become more depressed."

You know what's so upsetting about this? This is it's the same story we see when we've covered vaccines or everything else. And this is what it is. It's the regulatory agencies, folks. They're the ones that are part of the corruption. This is what you want to talk about a swamp? This is it. Because look at this for 65 years, you're telling me they know that this line of drugs, that this approach towards weight loss causes suicidal thoughts. And when they're overseeing and looking into the trials for Ozempic, wouldn't you think if your regulatory agencies care about you, they would at least ensure that the one thing this trial was doing was ruling out the fact that it would cause suicidal thoughts? That's the one thing, you know you should be looking for. And instead you look the other way while they take away things that have depression or any problems that might be affected this way. So you let them stack their own deck. It's not like this is accidental. This didn't just show up as this one drug suddenly has this problem. Literally, the entire line of drugs like this for 65 years has one major problem. And your regulatory agencies just push it all the way through. You've got children being recommended to take this thing and, oh, all of a sudden you have a rise in school shootings and couldn't have anything to do with pharmaceuticals. It's all about guns. This is the problem. This country is the problem with our regulatory agencies. And it's why we are very focused on stories just like this.

And I think we are part of just a small handful of voices in the darkness here against this massive marketing campaign to say, hey, we need to take a deeper look at this, because as you said, 65 years of history with dangerous here. This is why this is more dangerous. The only type of hype I've seen around drugs like this before is the opioids. Oxycontin,

Right.

Zoloft, the SSRI depression medication. Those things were blockbuster drugs. And they were kind of a new version of these drugs. You can almost, we're not going to but one could give a pass to the regulatory agencies and say, "well, this is a novel product. We're just hitting the market with it." As we know, they didn't do the correct studies. But with this drug, you have this history, so there's no excuse. And so we look at the prescription of how many of these scripts are going out. And we can see in like 2019, just a probably a couple hundred thousand, 2020. But by 2022, we're up to about 5 million. And 2023 is where this aggressive marketing campaign is really taking off. So I would imagine that is going to probably at least double.

It's hard to imagine it's only 5 million people when I run into as many people that are taking this, as many doctors as I know that are giving it 5 million is a pretty small amount of people inside the 330/40 million, whatever the count is at now in America. So it seems like it must have exploded recently.

I'm going to have to agree with you on that. Exactly. Because of headlines like this, because they're actually having shortages of these drugs. When you have heard of shortage, shortages of drugs that are just coming out? This is the headline, "Novo Nordisk Diabetes Drug Ozempic back in supply in us after months of shortage." And so starting to research this topic, I'm seeing the headlines, the suicidal thoughts. But then more headlines start coming. And this drug really has an uphill battle for itself. This was out of CNN. So this drug slows the gastric emptying of the stomach. So you feel fuller longer. This is CNN. "They took blockbuster drugs for weight loss and diabetes. Now their stomachs are paralyzed." Oh, my God. So, listen to these stories in here. These are just people that have these experiences. It says, "And even now, being off the medication for almost a year, I'm still having a lot of problems," Alan said. She said she was at urgent care recently after vomiting so much that she became dehydrated." Another person said "In September 2022, her vomiting got much worse. Standing in front of her classroom, Wright said she began having burps that smelled so strongly of sulfur and rotten eggs that the kids began to comment on it. What is that? Where is that coming from? They asked." So,

Wow,

I don't even know what to say it.
[00:18:06] Del Bigtree
Well, what we have to say to our audience out there is that these are pharmaceutical products. They have side effects. You have shown you time and time again that you are not being told the truth. Even here, reading the product insert, you won’t get the truth, which is rare. Usually there’s some truth to be found hidden in the fine print, as they say. But even here, your regulatory agencies are going out of the way to to protect the company over you. This is something that’s got to change immediately. It’s a major part of the work we do. But I also want to say what’s interesting about this, right, the suicidal thoughts connected to your gut biome. I think right now, as I’m reflecting back on Zachary Bush, who is one of the dynamic and brilliant minds that we’ve been lucky enough to interview on this show, and I’ll probably try and get him sometime in the near future. But all the discussions he’s had about how your stomach is really your second brain, so much of your serotonin and a lot of your emotional chemicals that are moving your body are directly connected to your digestion.

[00:19:06] Del Bigtree
Folks, if there’s one thing you do not want to mess with in this world, it’s your digestion. Okay? It just because I get it, we’re all having difficulty finding time to work out or really watch our diet, watch our food. But when you start messing with your stomach, God knows what can go wrong. What will happen to our children and what is the future of this? How many of these drugs, if you start slowing your digestion, slowing the slow way you are absorbing, toxins and nutrients into your body we just have no idea what the long term effects of that all are, all for some sort of short term gain. I just keep thinking, growing up, my dad said, there’s no such thing as a free ride. Everything has consequences. There’s a payment for everything. Just be aware of that. Be smart. It’s just all of this sounds a little too good to be true, apparently now showing us once again that’s the case.

[00:20:01] Jefferey Jaxen
Yeah. And it’s so important for people to do their own research, like we always say. And if you know somebody that’s taking this and they’re open to another form of information, maybe send them this clip and just plant a bug in their head so they can monitor their own thoughts. They can monitor their own health while they’re taking this, because, a lot of times they think, well, it’s just it’s just another weight loss drug. I’ll just take this. It’s no big deal. It’s not really that big of a deal. So Del last week, we talked about an unredacted version of an email by Tony Fauci at the beginning of the pandemic. He was giving an update to all of the people that he was talking to, trying to figure out was where did this thing came from, what kind of work’s going on in China? He had virologists. He had people like Jeremy Farrar at the Wellcome Trust really quarterbacking it as well. He had Francis Collins NIH. Well, that became unredacted by the select subcommittee that has been looking at the coronavirus response and all of its faults. And so we know that now. And what’s happened is we have Rand Paul, Senator Rand Paul, and he has called for basically Fauci to have prosecution for lying under oath. This is that what looked like in the media.

[00:21:06] Del Bigtree
Alright.

[00:21:07] Rand Paul, (R) Kentucky Senator
Anthony Fauci came before my committee. He said absolutely he funded no gain of function research in China. But we now have an email from him where he describes the research they’re doing and says, you know what? We are suspicious of the lab because we know they are doing gain of function research. He describes the project, but the project he described is the project he funded. So everything he’s been telling us from the very beginning has been a lie. We have documented that it’s a lie and it’s a felony to lie to Congress. And so I’ve referred him not once, but now twice to the attorney general of the United States for prosecution. But as you know, this attorney general is the most partizan attorney general we’ve ever had. And it’s good luck on getting him to do his job.

[00:21:52] Del Bigtree
Once again watching this government just cover up for all sorts of problems and this is a big one, right? This is going to be big. Our government agencies, you think about all the lying that went on, our president, pushing a vaccine that ended up not stopping transmission as was promised, jobs taken away, economy destroyed, and all of it around this virus that we have said from the beginning. Looks like it’s got Tony Fauci’s fingerprints all over it.

[00:22:18] Jefferey Jaxen
Yeah. And at the beginning, too, you had two camps that were really trying to figure out what was going on. You had Fauci, Collins, Jeremy Farrar, these higher ups at NIH, Bethesda, Bethesda Boys, they called them. And then you had the the virologists, the actual nuts and bolts scientists, the evolutionary scientists, and that was the other camp. And they had their own separate conversations. And what came out of all of that was the paper. This was the paper, remember, everyone was trying to figure out what happened. Where is this going? "The proximal origin of SARS-CoV-2" this was published in Nature. And this really at the beginning of the pandemic, killed the conversation of the lab situation, the lab leak. And it says here, "our analyzes clearly show that SARS-CoV-2 is not a laboratory construct or a purposefully manipulated virus." And so what that did and that was early on in the pandemic that just kicked off the media ran with this hook, line and sinker. That’s what it looked like. Check this out.

[00:23:18] Female News Correspondent
This whole notion that the coronavirus was developed in a Chinese lab that has been debunked.

[00:23:24] Male News Correspondent
The people saying it's man made, that's been pretty much completely debunked. The scientists say no. When you look at its genetic makeup and the science behind it, it has not been altered.

[00:23:35] Female News Correspondent
Dr. Anthony Fauci rejected the conspiracy that coronavirus was man made in a lab in Wuhan, China.
[00:23:41] Anthony Fauci
This could not have been artificially or deliberately manipulated.

[00:23:46] Male News Correspondent
A lot of people on the right love that phrase escape from the lab because it sounds like something from a Marvel movie or a comic book. It sounds like they are talking about a manmade virus that China was weaponizing that got out of control.

[00:23:57] Male News Correspondent
You see, it turns out Corona was never just a virus. No, it was actually a weapon created to take old people out.

[00:24:06] Female News Correspondent
Donald Trump is still pushing the debunked bunkum despite his own intelligence community's findings that that is simply not true.

[00:24:13] Del Bigtree
It's really incredible to watch how poorly all of those news reporters are aging on this subject. And yet I don't know that we've heard an apology from any of them and why anyone tunes in to hear what they have to say. What you saw is the failure of modern news agency or reporting, which is it's doing the same thing as science. It's running on assumptions. It's running on expert opinion. And frankly, to all of my peers out there in journalism, you're supposed to have a little red flag go off when you recognize that over the years, Tony Fauci has been embroiled in an argument over whether we should be doing gain of function research. Clearly, if something went wrong, someone close to that would be trying to cover it up. So the way they took it, hook, line and sinker from this guy, Tony Fauci, of all the people in the world, it didn't take a rocket scientist to say, you know what, This guy has got his fingers in this space. We certainly can't just take his word for it. The first thing he would obviously do is try to cover this up. And yet that instinct does not seem to exist in journalism anymore except, in the very few places. And the two of us are sitting here on the Highwire for everybody that was paying attention. We were skeptical from the beginning and, by the way, sacrificed our YouTube channel, sacrificed our Facebook channel for stating the obvious, which is we do not see the evidence that you can prove that this is a natural virus.

[00:25:35] Jefferey Jaxen
And what ultimately ends up being the truth is, is not not important, because what we're going to go through is kind of a forensic. It's not important for this segment. What we're going to go through is kind of a forensics of how the medical community creates a narrative. And you just saw the end result of that. The media just grabs it and repeats. So we have, thanks to the coronavirus, the select committee and the coronavirus pandemic, we have the Slack Channel. So the Slack is a private communications messenger system, and that's the second camp the virologist and the scientists they were using as one of the forms of their communication was the Slack channel. They were communicating with this, not Fauci, not Collins. They weren't on here, but the virologists were. And one of them was Kristian Anderson. He Scripps Institute. He's one of the authors on the proximal origin, and he was one of the leaders. When you start reading this slack, these slack messages, one of the leaders in really driving this narrative in a gentle way and sometimes not so gentle. So let's look at some of the messages here. So this was February 1st. So this was right when it was all kicking off. Fauci's going, what the heck is going on? I need meetings. These guys are talking behind the scenes. Kristian Anderson says this. "I think the main thing still in my in my mind is that the lab escape version of this is so freaking likely to have happened because they were already doing this type of work. And the molecular data is fully consistent with that scenario."

[00:26:59] Del Bigtree
Pretty strong statement. That's a strong statement.

[00:27:02] Jefferey Jaxen
That's a strong statement.

[00:27:03] Del Bigtree
Completely opposite, freaking obvious that it looks like it came from a lab. Okay.

[00:27:07] Jefferey Jaxen
Completely obvious, completely opposite of what he wrote and put his name on it. Proximal origins. But let's continue. He goes on to say this. Both Ron and Kristian. Now, those were other scientists, "both Ron and Kristian are much too conflicted to think about this issue. Straight to them, the hypothesis of accidental lab escape is so unlikely and not something they want to consider. " Now, Kristian Anderson goes on to say this "The main issue is that accidental escape is, in fact highly likely. It's not some fringe theory. I absolutely agree that we can't prove one way or the other, but we'll never be able to. However, that doesn't mean that by default, the data is currently much more suggestive of natural of a natural origin, as opposed to, for instance, for example, passage. It is not the fear and cleavage site. It's very hard to explain." Now then you have the addition of another scientist. This is Andrew Rambaut. He's from the University of Edinburgh, a molecular evolutionary professor. And he goes on to say this now we start talking politics. He says, "Given the s show," you can kind of fill in the blank there. "That would happen if anyone serious accused the Chinese of even accidental release. My feeling is we should say that. Given there is no evidence of a specifically engineered virus, we cannot possibly distinguish between natural evolution and escape. So we are content with ascribing it to a natural process."

[00:28:29] Del Bigtree
Wow.
[00:28:30] Jefferey Jaxen
Just pause there for a second. He's saying because we're kind of afraid of China, we have evidence, but we really don't have the smoking gun evidence, So let's just forget all that and let's just let's just put this into rest because.

[00:28:42] Del Bigtree
Yeah, for everyone that may be watching. The HighWire now if you watched it for some time, you're now going through all the videos, all of the Stanley Plotkin on the stand for vaccines where there's an absence of science. I assume safety in all of these things. Assumption, assumption, assumption, assumption. It is horrifying. The day you wake up and recognize that science, the word is you knew it where it was proving a point, proving a hypothesis, challenging it. I don't know how many decades ago that disappeared, but clearly the science we swim in now is just a religion. It's political. And what you are watching is how opinion and assumption and a desire to paint a picture overcomes and succeeds in drowning out the actual truth. And it's really, really horrifying. And this is in almost every branch of science now, totally corrupted. Just as I sat here in my debate with Neil deGrasse Tyson and I said, Science is dying, I am desperately asking you to help me try to revive it. This is so scary to watch this happening. And how many millions of lives are affected by these types of, political discussions, not science discussions.

[00:29:52] Jefferey Jaxen
Right. And so you have Rambo says, we don't want to really do any kind of accusations towards China at this point. So, Kristian Anderson, this is still early February, the first week in February. Kristian Anderson says this to to the China comment. "Yep, I totally agree that that's a very reasonable conclusion, although hate although I hate when politics is injected into science, but it's impossible not to, especially given the circumstances. We should be sensitive to that. Plus, none of this matters at this moment." Then he goes on to say this "I'm starting to think that for outbreak research, the Biorxiv really needs to start screening submissions. It's a slippery slope, but it's justified at this stage."

[00:30:31] Del Bigtree
Just leave that up for a second. I just. Just leave that up. Everybody, take a look at this. We talked about Andrew Hill and how he, turnscoats on the entire discussion around ivermectin and those things. But look at this. This guy started out by saying I am it is so freaking obvious this came from a lab. And look how quickly he sells out. What a weak human being. And this is when we talk about Nazi Germany, how do people go down that slippery slope? Not that I'm calling Kristian Anderson a Nazi, but this is the compromise of humanity. And where does he go? At first it's like, "no, anybody that's saying this didn't happen in a lab is crazy. We got to forget about our friends that are just totally addicted to lying to the people." And then he ends up saying, "not only am I totally in agreement and I will lie to the people, we better start censoring all of the documents coming in to the open space science community, because if we don't stop it there, the truth might actually get out." Look how quickly this guy just throws science to the wind and becomes a shill for the lie. Unbelievable.

[00:31:36] Jefferey Jaxen
And these messages have not just passed in the in the dark of the night. So the media is picking up on this. A lot of people are talking about this. This is one of the headlines here. "Prominent scientists downplayed Covid lab leak theory to avoid upsetting China." But, it makes me think, we start seeing all of this and we we think back to how hard comedians were aggressively basically attacked, neutralized, destroyed during the pandemic because they were able to just take these complex ideas and break them down to simple things. And who would have thought that Jon Stewart, of all people, would have probably had this thing sewn up in the early days?

[00:32:13] Del Bigtree
The greatest scientific mind of our times.

[00:32:15] Jefferey Jaxen
Yeah. With a monologue like this, remember this? Take a look.

[00:32:20] Stephen Colbert, The Late Show with Stephen Colbert
What do you mean by that? Do you mean like perhaps there was a chance that this was created in a lab? There's an investigation.

[00:32:25] Jon Stewart
A chance?

[00:32:26] Stephen Colbert, The Late Show with Stephen Colbert
Well, I. If there was evidence. I'd love to hear it.

[00:32:29] Jon Stewart
There's a novel. Respiratory coronavirus overtaking Wuhan, China. What do we do? Oh, you know who we could ask? The Wuhan novel Respiratory Coronavirus Lab. The disease is the same name as the lab. That's just. That's just a little too weird, don't you think? And then they ask those scientists, they're like, How did this. So wait a minute, you work at the Wuhan Respiratory Coronavirus lab, How did this happen? And they're like, Oh, a pangolin kissed a turtle. And you're like, No, you the name of your lab. If you look at the name, look at the name. Can I. Let me see your business card. Show me your business card. Oh, I work at the coronavirus lab. In Wuhan. Oh, because there's a coronavirus loose in Wuhan. How did that happen? Maybe a bat flew into the cloaca of a turkey and then it sneezed into my chili. And now we all have Corona. But, like, Come on. Okay, okay. Wait, wait. What about this? What about this? Listen to this.

[00:33:39] Stephen Colbert, The Late Show with Stephen Colbert
Wait a second.
[00:33:41] Jon Stewart
Alright.

[00:33:41] Stephen Colbert, The Late Show with Stephen Colbert
John.

[00:33:42] Jon Stewart
Oh, my God.

[00:33:43] Jon Stewart
Oh, my God. There's been an outbreak of chocolatey goodness near Hershey, Pennsylvania. What do you think happened? Like, oh, I don't know, maybe a steam shovel mated with a cocoa bean. Or it's the chocolate factory. Maybe that's it.

[00:34:05] Del Bigtree
Not that he gets it all right, but it seems like he's aging pretty well with that scientific statement right there.

[00:34:11] Jefferey Jaxen
Right. And so, as you would think, there is a petition out there now to retract this paper, to kind of reshuffle the deck on the science. This is BiosafetyNow.org petition "retract the proximal origins of SARS-CoV-2, a fraudulent paper on the origin of Covid 19." Anybody can go there, sign that petition now, if you think your voice to be heard on this and really just try to get science back to a neutral spot after this, this dark age of suppression and manipulation and narrative control, that's that's where we're at right now with this.

[00:34:41] Del Bigtree
I love it. Let's bring that back up, everybody, because this is where we get to have some fun on the Highwire. Let's show them. They want to get what do they need? Another 1000 there? I think we got that. Let's do this. Everybody grab change.org/p/retract-the-Proximal-Origin-of-Cov-2. We will also have that in our comments. And if you are part of our newsletter, you will receive that. But let's show them what we can do here on the Highwire. Let's just push that right over the top because this is important that has to be retracted. This is an abomination of science. It cannot stand. And it's all a part of our goal to eventually see Tony Fauci put in a trial. And we've got to start removing the science that they faked and lied about. And we this is where we have power, right? This is where we can speak out. This is a part of our cancel culture. Let's cancel bad science, shall we?

[00:35:33] Jefferey Jaxen
And so afterwards, this thing is kind of receding. Covid is kind of in the rearview mirror. And we have, the medical industrial complex. People talk about that all the time. But we've had this like branch off this little bubble that came off of that of a pandemic industrial complex. It's his own it's his own thing with its own marketing arm and its own products and its own, striving for its own individual offices and power systems and products that look like this. You may see this on your kid's shelf, a virus, playset plagues of the 21st century. Yes, that's right. Covid, flu, SARS, Zika, measles. Have your kids spread knowledge and not disease. Be the super spreader of knowledge.

[00:36:12] Del Bigtree
Wow.

[00:36:13] Jefferey Jaxen
So you get to have a plush toy with your favorite, I guess, virulent disease, but

[00:36:18] Del Bigtree
You too can raise your own personal hypochondriac.

[00:36:21] Jefferey Jaxen
Yeah, exactly. I don't know if that person would be very fun at parties or kids events, But anyway, so in seriousness, the White House has launched an Office of Pandemic Preparedness and Response. This is the the kind of the newsletter that went out or the press release. And we go into this here and it says this What is it going to do? "It's going to coordinate the administration's domestic response to public health threats that have pandemic potential" or get this or "just may cause significant disruption." That's a nebulous term "and strengthen domestic pandemic preparedness. This includes ongoing work to address potential public health outbreaks and threats from Covid 19, monkeypox, polio, avian and human influenza and RSV." And then it gets into the nuts and bolts. How is it going to do that? "Specifically, OPR will oversee efforts to develop, manufacture and procure the next generation of medical countermeasures, including leveraging emerging technologies and working with HHS on next generation vaccines and treatments for Covid 19 and other public health threats." And Del, it's not a fleeting moment. This thing is going to be in The White House it's permanent. This is stat news. "White House launches permanent pandemic office." And those were the words in that press release. This is going to be a permanent position. It's in the executive branch of the White House. So this thing is sitting it's encapsulating right in the president's office, if you will, you have this this vacuum sealed pandemic office. And think about why they're doing that. So who are they putting at the head of this? Remember, we did a whole expose on Dr. Deborah Birx. Where she came from, the military background she had. The National Security Council she was thrust to the head of that. She was put and she was basically responsible for the pandemic response,
Jefferey Jaxen

Right. And remember Scott Atlas's book? He was the coronavirus advisor to Trump. He came in there. He said, some weird things happen. They're going out and publicly countering what the president is saying. He's saying the opposite. No one can criticize her. She's doing all the state visits on her own. This lady was really heading things up. So who's heading this pandemic office in the White House? This new one now a retired major general, Paul Friedrichs. Now. Who is he? He came from the Pentagon. He was a medical adviser to the Department of Defense, Covid 19 task force. And he was from the National Security Council, just the place that Deborah Birx was heading during the Covid response. He was from the National Security Council, and he has now been picked to come up to the office and run this thing. So this makes me think when we start connecting dots so we have this plug and play situation here and it's a closed system, so it's already in there. You have ex-military running it from the Pentagon and you're not going to get to this porous boundaries. You're not going to get a Scott Atlas floating in there and disrupting things. You're not going to get a Robert Redfield saying like, hey, we really need to investigate Wuhan, China.

Jefferey Jaxen

This thing is closed, start to finish. They're going to they're going to work on the vaccine development from that space. But remember, the W.H.O. has the legally binding treaty that it's been working on and for the international Health regulations. And here's a headline from just a couple of months ago. So there's a lot of moving parts here that seem to be gelling. "How the World Health Organization could fight future pandemics." It says here they have a "target date of May 2024 for a legally binding agreement to be adopted by the UN Health agency's 194 member countries." And we have Tedros in there saying that this is a generational commitment. That's the words he's using. So this is something they really want to make sure sticks and not go back to the old way. He's saying. And remember, we have Jeremy Farrar going in there as the chief scientific officer of the W.H.O.. He at the Wellcome Trust co-founded Cepi. So there's a lot of players that are now moving into this space, making this like some big leap big league movements right now. We have to pay attention to this. We have to get out front on this.

Del Bigtree

It's really amazing in many ways. As you were talking about this, I just thought this is the new war economy, right? This is the war on nature, on disease, on the pandemic. And the military is running it, not doctors, military. And you think about all of those dystopian novels and especially 1984, that has some distant war that doesn't really make sense to anybody, but it keeps us all sort of locked in our own space trying to stay safe. This is just this ongoing, intangible, invisible war that we are pouring billions and billions of dollars, and the pharmaceutical industry is pouring billions of dollars into our government officials and buying up our regulatory agencies that are refusing to do any proper safety trials. The whole thing is really, really a mess. These are these are dark times, and there's some solutions there. I think the beauty is the work that you're doing that we're doing here on the Highwire, other podcasters, guys like Ice Cube, they're going to get out there and start speaking truth to power. This is a moment for the people to really step up and make a difference. So it just thank you for for doing these deep dives where everyone else is afraid to go. It's really great work and especially Jefferey. I want to thank you because you do you go beyond sometimes just doing the investigations. You were just in giving testimony in Massachusetts where they're trying to, this archaic idea of removing the religious exemption from vaccinations right after we won it back in Mississippi, having lost it since 1979, there's still states that want to move back into the dark ages and take away people's rights to opt out or to have a religious perspective. Maybe they don't want to be injecting aborted fetal DNA into their children. But you were you gave a great testimony. So I want to want to play that right now. Let's take a look at this.

Jefferey Jaxen

I sit here as a medical health journalist for nearly a decade telling the story of parents that you've heard here. This is a common story, telling the story of parents who had vaccine injuries. Their children had vaccine injuries after mandated vaccines. We hear a lot about the immunocompromised child excuse me, immunocompromised child in these bills trying to protect them. But there's another side of the story. There's vaccine injury. It is real and it's been paid out to a tune, as you heard, of, over $4 billion by the vaccine injury compensation program. This is a liability free product that market forces do not apply to it as it applies to the rest of the products out there. Unfortunately, these parents have been discriminated against and essentially neutralized by the media trying to tell their story and also by public health agencies. And as you've heard by the medical profession, when they try to get their children help, they need. One of the things that we're left to do is to use legal actions and journalists that are outside the corporate media, if you will, that are influenced by big pharma as they take their money and the legal the legal actions that have been pushed towards the public agencies like the CDC have found things like this, CDC and NIH unable to provide a single study to support the safety of injecting aluminum adjuvants, which are widespread in childhood vaccines. CDC concedes it's never conducted a vaccinated versus unvaccinated study. These are things that we need answers to, and these are inconvenient facts that should have been debated publicly in the public space. And unfortunately, they haven't been. We've just finished a Covid response where the CDC has admitted it did a lot of wrong things that hurt public trust. And fortunately, I was expecting to see bills that would enshrine more public trust and these civil liberties in these bills. And I'm fortunately not seeing that.
Del Bigtree

Amazing job, Jefferey. And just to point out to everybody, it's not easy to get in those microphones. I find that to be some of the most stressful things I've ever done is sort of speaking to, in those political spaces. But no teleprompter, no script Jefferey That was awesome. And, I also want to point out that the video glitching was theirs. That's how the feed came out. It's not us, having a mistake with the video. That was the best that it came out. But and also, Aaron Siri weighed in. So let's go ahead and listen to that. And I'm going to ask you a few questions. This is Aaron Siri that I think came in on Via Zoom or something like that to this same hearing. Take a look at this.

Aaron Siri, ESQ, Civil Rights Attorney, Siri & Glimstad

Good afternoon. My name is Aaron Siri. I'm an attorney. My firm has over 30 professionals that engage purely in vaccine related work. We do not represent pharmaceutical companies. So we we represent people who are injured by vaccines. We do vaccine policy work. We brought, for example, a lawsuit in Washington, DC, challenging a law that had permitted doctors to vaccinate minors without parental consent, and it got struck down. We also recently brought a lawsuit in Mississippi which challenged a lack of religious exemption there in a federal court held that it violated the First Amendment right to free exercise, not to have a religious exemption in the state of Mississippi has now re-instituted a religious exemption in that state. You've heard a lot of testimony today from parents. Some of the very emotive. I really do want to stress these are real real hardships. These families are going to suffer greatly if you remove the religious exemption. The folks don't always listen to what parents have to say, but when they're telling you this is their convictions, you should trust them you should believe them. That's what this country was founded upon. It was letting people live out their convictions. And if can't, appeal to your emotion, maybe can appeal to some of your logic. Let me read you some quotes. Here's a quote from the CDC about inactivated polio vaccine. The only vaccine for polio using that is safe last 20 years, quote, "IPV inactivated polio vaccine does not contain live virus and cannot cause disease. It protects people from polio disease but does not stop transmission of the virus." End quote. That's the CDC, because it creates a systemic immunity in the blood. It doesn't create any mucosal immunity where polio proliferates. The same is true of at least four of the six vaccines that you are talking about. They do not prevent transmission. Not my words. That's the government words. There is what you're told about vaccines and there's a reality. And when you litigate it, you have to actually look at the facts and proof. And I can tell you what you're often told is not accord with what the facts show. Thank you.

Del Bigtree

Wow. Amazing. ICAN's own Aaron Siri there. And he puts he points out such a great point. You're talking about the injuries. These are real. These people are real. They need a recourse. They need to be in a way to opt out. We need to be able to have people that can avoid being injured. But as he pointed out, four of the six of these products we've talked about a lot don't stop transmission. Just like Covid had the same issue. And at the heart of these laws is always we've got to protect the immune suppressed child. How do you protect the immune suppressed child if all you're doing is creating asymptomatic carriers? In fact, most of these vaccines, what we find is that they're more likely to be carriers after they get the vaccine because their body never mounts a totally, virus killing defense. It lets it linger around in their bodies so they keep carrying it around the immune suppressed child. This is where we've been attacking this and having a lot of effect around the nation. But what all is going on in Massachusetts? Is this the only law? It just seems like they're really out of step with America right now and where people are at.

Jefferey Jaxen

Yeah, that's a great analysis. And Massachusetts is one of the big pushes right now. And it's interesting because obviously we've we've been covering these legislative pushes since California like 2014, 2015. And that was before the pandemic response. As I said in my testimony, everything changed. The public trust is not a given right now. We have people questioning, questioning, asking questions, and then we have RFK Jr going on and trying to push this push. People now in their minds are like, wait a minute, we should have a big open debate about all vaccines. So this legislation is is interesting because it's a little myopic in that it's picking up at the same pace it did before the as if coronavirus response never happened, as if people are still in that same thing. So in Massachusetts right now, we have a bill. It's H2151. The companion bill is S14.58. But what this is doing is it's lowering the age of consent for vaccinations. So remember in Washington, DC, we had this idea of the minor. They passed this bill of the minor consent and they brought that down. It was covering it at the time, too, at the age of 11. They said, We think that's reasonable. And they were using these words. We're going to try to remove the parent barrier.

Del Bigtree

Because 11 year old has a full understanding of all of their previous issues, health issues that their parents have been watching. And they know all about their own health history.

Jefferey Jaxen

Right. And the question would be, do they know about vaccine injury moving forward? Do they know about the signs and symptoms of that? If their parents are kept in the dark of the vaccination, the parents, do they are they able to watch out for this child after the vaccine to see if they develop anything? So they Massachusetts is pushing forth this bill to lower the age of consent to whatever. No, no. Any age. And they're also that same bill also allows schools, daycares, colleges to establish their own vaccine policies. And they can actually add more vaccines that are on the schedule. And remember Del the the Covid 19 vaccine has been pushed to the recommended and we covered this about six months ago when I was in studio. We really have to watch for the beginning of this school year because Rochelle Walensky, the CDC director, said the only reason we put this on the schedule was so we can so we can get paid for by lower for lower income children had nothing to do with science. So if these schools now add this Covid 19 vaccine as a as a requirement for school entry, it's going to be very interesting because there's really no science. And the CDC director said that. So another bill is H.604, and its companion Bill is S1391. This one's among other things, it's going to try to remove the religious exemption. So Massachusetts, if this goes through, will be amongst a minority of states that have no religious exemption, Maine
One of the one of the focuses, it will become one of the focuses of the The HighWire to go in and bring a lawsuit to stop these bills. That's what they're going to do because that's where we can actually make a difference. Obviously you're they're trying to preempt that, bring some truth to power. But if they decide to push forward with this, we're going to do something about it.

Jefferey Jaxen
Right. Right. And and the final bill here is H. 582. And it brings it actually gives doctors and medical professionals a kind of a wider breadth for medical exemptions. It protects them against any retributions, kind of like we saw in California. Doctors were losing their license left and right and they were actually losing those for for just speaking out during the Covid 19 response. So this is kind of something that's attempting to protect that those movements against those doctors. So however you feel about these these bills, it's important you can sign up for online testimony. You can show up in person as these things move forward. It's just important to keep an eye out for these things in your states. And again, it seems like Massachusetts is kind of a frontrunner right now and pushing this legislation. But I know other states are starting to gear up, too, in time for the school to school year to start.

Alright, everybody. Well, look, you can sit back and just watch and see how your world gets taken away from you or you can step up and. Do something about it. Jefferey Jaxen. Thanks for stepping up. That was amazing. Great testimony. And again, great reporting this week. I'll see you next week.

Jefferey Jaxen
Alright. You're welcome. Thank you.

Alright. Well, every once in a while on the Highwire, things perhaps don't get stated exactly right. And we want to make sure that you can be confident that when you are watching the Highwire, that we have done our due diligence and we have the science nailed to the wall. This is one of those moments where I'm going to have to say that we didn't fully state something right. This was revolving around the story, around trans men or trans women. I forget which way that goes, but that wanted to chest feed and were taking drugs so that they could lactate. We talked about how this drug had a lot of side effects. It was dangerous to be taken for short periods of time and they were over the top that it was like twice as much as they should be taking. This is what that moment looked like at Freedom Fest. Take a look at this.

Jefferey Jaxen
On physical examination, she was able to express droplets of milk. The domperidone dose was increased to 20mg po quid. So now we have 20, 40, 60mg a day.

Del Bigtree
Double the dose every day.

Jefferey Jaxen
Double dose every day.

Del Bigtree
Max dose.

Jefferey Jaxen
Max dose.

Del Bigtree
So Jefferey was stating that it was three doses throughout the day. Well, we have a very smart audience of doctors and nurses. Many of you wrote in this is what one of those statements was. Nurse Penny here, quid is four times a day, not three. Qd is daily Po means per OS, which means by mouth. This means that the patient was getting 20mg four times daily. The max safe dosage for the adult was exceeded by 50mg daily. What might this mean long term for the child? I guess all that screaming Fauci and company did about requiring randomized double blind placebo controlled trials only matters when the NIH, CDC and FDA are trying to block early and effective treatment for Covid 19. So we were right that they were taking way beyond the max dosage. It was just worse than we thought. But we wanted to make that clear to everybody that and we want to thank those people always. You should write in. This is important to us that we get it right. And so in this case, it's one of the rare moments, I think, that this may actually be like our second correction, but correcting ourselves is part of the Highwire protocol. And this is if you want to find out where that is, you just have to go to thehighwire.com, scroll to the bottom of the page and you can read all about it right there. The high wire protocol. It lists what this means. It also talks about the fact that we will correct statements if we get it wrong. But most importantly, there is correction of errors or misstatements made in an episode of the HighWire shall be corrected in the following week's episode or no later than four weeks from original air date of said error.
[00:55:00] Del Bigtree
For those of you that may be brand new, this is a protocol that we’re demanding all other news agencies use, which is we hand you our data, we hand you our science you will never hear. Well, Tony Fauci said that it happened. It didn’t come from a lab. It was natural. Therefore, it’s been debunked. No, it hasn’t. You have an expert that is biased because his fingerprints are all over the cookie jar that he stole a cookie from. And so that won’t happen here. We’re going to send you our science, our data. It's given to you every Monday after a Thursday show. It's shocking how few of you really take use of this. You should be signing up right now because this is how you win your arguments at the dinner table with family and friends. Just go. All you have to do is put in your email address right there. We don’t give it out to anybody else. This is how we can connect with you. But also you can get all the science, all the evidence, all the links to the videos, everything. You don’t have to go trying to figure it out. It’s right there in your inbox so that if you see something you like, you can look deeper into it. If you want to question our science where we’re coming from, you get to read all of it.

[00:56:01] Del Bigtree
So that’s the Highwire protocol, folks. This is how we do it. So as I said, there are laws. They are still trying to take away your rights. There’s an authoritarian regime, if you will, that is attempting to take away control of your own body. I’ve said it before, if you don’t have the right to decide what’s going into your body, then you have the same rights as a farm animal. Forget about being a free citizen. The government considers you property if you don’t want to be property. And if Massachusetts decides to pass that law, or maybe you want to fight the other states that have already taken away the right to religious exemption. This is a spiritual war. This is a war of light and darkness. And ICAN our nonprofit and our legal team is the most successful group to ever fight in the health freedom space to fight for your religious rights. And we need your help now. There are more attacks are coming. We are going to jump into courtrooms, but it’s very expensive. You can’t imagine the millions and millions of dollars it takes to fight these in every state, everywhere it’s happening and you are making that possible. So for every one of you out there that has been a sponsor and helping us, I want to thank you for all of you that are watching this show that enjoy what we’re doing. Love hearing about the great wins, like the big win in Mississippi that we celebrated just over a week ago, adding bringing back the religious exemption that was gone since 1979.

[00:57:25] Del Bigtree
Instead of going, "Wow, great job, guys," you get to pat yourself on the shoulder and said, I actually did something that means something. And what appears to be more and more a meaningless and crazy and chaotic world. If you want to feel that they want you to become recurring donor, just go to the top of the page right now theHighwire.com or at ICANdecide.org hit the donate to ICAN button become a recurring donor. We’re asking for $23 for 2023 but you can make it whatever you want. I don't care how much it is. I want you to feel what it feels like to be a part of change, to actually feel how good it feels to make a difference in this world. Alright. Well, speaking of this crazy world, I don't know about you, but it just seems to me that we were doing a lot of reporting. We were talking about athletes that are collapsing and, soccer fields and softball fields and in practices and games all around the country. And then there seemed to be I don’t know if social media shut those stories down, but it seemed like that kind of quieted down. And I think we all thought maybe we’re through it. And then suddenly, just over this last week, it’s just felt like just more and more stories like there’s this wave happening. I don’t know if there is, but this is what it’s look like in the news.

[00:58:39] Male News Correspondent
Bronny James suffered cardiac arrest while at a practice.

[00:58:43] Female News Correspondent
He was live on air when Shaka Hislop suffered a medical emergency.

[00:58:47] Mitch McConnell
Tori Kelly recovering this morning after collapsing in public, reportedly now being treated for blood clots.

[00:58:54] Male News Correspondent
Jamie Foxx is now reportedly recovering at a physical rehabilitation center.

[00:58:58] Male News Correspondent
Specializes in treating patients with stroke and brain injuries.

[00:59:02] Jamie Foxx
With tubes running out of me and I just didn’t want you to see me like that, man.

[00:59:07] Female News Correspondent
She passed out at dinner after her heart began beating rapidly, saying Kelly was out for a while. She was carried to a friend's car and rushed to Cedars-Sinai Hospital, where doctors reportedly found multiple blood clots near her vital organs.

[00:59:21] Male News Correspondent
Tomorrow morning, Deion Sanders is set to have emergency surgery to fix blood clots in his legs.

[00:59:28] Female News Correspondent
The Senate Minority leader, Mitch McConnell had to be escorted away from the cameras after freezing.

[00:59:33] Mitch McConnell
Good Bipartisan cooperation and a string of
[00:59:58] Female News Correspondent
Are you good? Yeah.

[01:00:01] Male News Correspondent
Hey, Mitch. Let's check. Anything else you want to say? Sure. Let's go back to your office. Do you want to say anything else to the press?

[01:00:09] Mitch McConnell
No.

[01:00:09] Male News Correspondent
Okay. Let's go back.

[01:00:10] Female News Correspondent
Alyssa Carlson suddenly collapses during the live 7 a.m. broadcast.

[01:00:16] Female News Correspondent
Our colleague Elise Finch passed away yesterday. Her death is sudden and unexpected, leaving us all trying to understand how this could happen to our beautiful Elise, who was just 51 years old.

[01:00:30] Male News Correspondent
The cardiac arrest. What exactly triggered that? What caused that? That's what the doctors are going to be sort of investigating.

[01:00:36] Male News Correspondent
It's still unclear what sent Jamie Foxx to the hospital.

[01:00:39] Jamie Foxx
I went to hell and back.

[01:00:41] Female News Correspondent
This is a significant issue and it is a medical emergency.

[01:00:44] Female News Correspondent
It's not clear if weather played a factor.

[01:00:46] Male News Correspondent
This is rare.

[01:00:51] Del Bigtree
Just as I said when we were playing the athletes, the videos that we have not want to be clear. We have not done an investigation to find out if all these individuals have gotten the vaccine. We don't know for sure whether or not these incidents have anything to do with the vaccine. But what we're asking as journalists, as reporters and as a network right now is do we ever remember a time where there was this many incidences of people collapsing, of having blood clots, of having heart attacks, of having strokes, and then this term suddenly died, suddenly is now everywhere? I even saw a meme recently that really stuck with me is the leading cause of death. Now, suddenly, and we've been looking at data around the world, but we're not alone. This isn't a conspiracy theory, really. This is one headline that is obviously alarmed. "Experts Call for urgent Investigation as Excess Deaths spark dangerous Theories." Obviously, they're worried about our imaginations running away with why are people dying at higher rates. This is what it says, though, and this is something we've talked about "of particular concerns the 15 to 44 age group where cumulative deaths are tracking above all recent years, including 2020." That's the youth of America. There's the young people and the and the healthy working group in America around the world. I'm joined right now by someone that I think really has had a really beautiful, objective view on this, not necessarily a medical view, but just a numbers crunching view because he used to be an executive at BlackRock, crunching numbers. What he does, it's my honor and pleasure to be joined right now by Edward Dowd. Hi, Edward.

[01:02:32] Edward Dowd, phinanceTechnologies.com
Thanks for having me on. Good to be here. Thank you.

[01:02:35] Del Bigtree
It's good to have you. And again, under really horrific for really horrific reasons. But I've been thinking about you a lot. I really have, because we keep watching, especially data in England. I'm not sure our data in America, it just feels like it's being corrupted on purpose or is just tracking really slow. But when we look out there, there's just this an alarming trend. And is it our imagination or how bad? How bad is it?
[01:03:05] Edward Dowd, phinancetechnologies.com

No, it's not our imagination. And you mentioned in the lead up to introducing me, there seems to be a new rash of incidents of celebrities and athletes collapsing and and what you have recently. And the metadata actually supports that. US disabilities, as reported by the Bureau of Labor Statistics, hit a high in September of 22. We started accelerating in September of 21st February of 21, we added 3.2 million Americans to the disability survey, and then the rate of change kind of stopped and it was hovering around the old highs. And then in May it broke to a slight new high. And then in June we added 850,000 people. So we added 1.2 million in 2 months. So there's something going on in the general population that's reaccelerating something. And anecdotally, I don't have the data yet, but I'm hearing from some of my insurance whistleblowers that their short term and long term disability numbers are accelerating. Again, they're having panic meetings about it, but they most times they don't mention the obvious elephant in the room. They see excess deaths amongst the millennials 25 to 44 in their group Life insurance continuing at abnormally high rates around 23/24%, excess mortality. So whatever's going on, we all know what we think it is. Whatever's going on is a disaster. And, you know, recently we just dropped our disability data.

[01:04:37] Del Bigtree

Before we get into that, before we get into that, Edward, I just want to talk to you one minute, because the anecdotal part of this that has actually been dystopian for me as I travel the country a lot and everywhere I go, the people I talk to, every restaurant I walk into has a help wanted sign. Everywhere I go, I talk to construction contractors like I can't find anyone to do the work. I can't find workers everywhere I go. I was just I flew into Memphis and they said, we don't have any rental cars. There was one budget rental car and there was that one place had a line that was like out the door and down the block, and the rest of them were just people sitting there. And then some guy says, it's not that they don't have cars, they don't have workers to bring the cars or wash the cars or whatever it is. And I don't know. But it is starting to feel like images of the Soviet Union, where there's bread lines for the one thing that's available. And we just keep hearing that there's I keep hearing the economy's great. We have a very low unemployment rate. How do you have a low unemployment rate and all the jobs that used to be filled? Just three years ago, we had a working nation. We had restaurants where the service was great. Now I can't find anybody to bring me, some ketchup. It's like we're grinding to a halt and I just keep thinking we're being lied to. It's like there's no one here to work. Where are these people? Is this what this is?

[01:06:08] Edward Dowd, phinancetechnologies.com

You and I are characters in a dystopian film, unfortunately, and we're in the know and many people aren't, and the numbers are actually reaffirming what you just said. So the disability numbers went up to 4.2 million from a survey in the US. So so that's an additional 4.2 million disabled workers. More than half of those are employed. So the employed workforce was hit hard, so that's disabled. We also have a category called injured. So there's two things going on. You get people getting kicked out of the workforce through death that were employed. That's small number relative to the numbers we're talking about. Then disability. Then we have a category called injured where they're chronically sick. That data we found at the US Bureau of Labor Statistics as well, where lost work time is 13 standard deviations above 20 year average, meaning, you know, people are missing work. And so what that does so you have the disabled, you have the people who are chronically ill, then you have those who are left who are okay having to cover for these people and their staff shortages, help wanted signs and it's dystopian. The anecdotes are coming in hard and fast.

[01:07:17] Edward Dowd, phinancetechnologies.com

Friend just flew here to Maui. There were mechanical issues on the plane. They had to swap out planes and it's mechanical because they don't have people to do the work. Colonel Teresa Wong and the military talked to me months ago saying if we continue along this path between the disabled, the dead and the injured and the fact that they can't recruit due to the woke political environment, we won't have a standing military in five years. Meaning, you know, for one pilot to fly, it's ten support people behind that pilot. And what you said about the Enterprise Rent-A-Car, same thing. The supply chains are breaking down the Fed. The Federal Reserve is looking at the employment number, which is wrong. Luke Grumman, a mainstream economist, pointed out the disability figures going to new highs and he said maybe there's something going on here. He didn't mention the vaccine, but now it's getting into the mainstream conversation that something is going on with our workforce. And I was with you in December in front of Senator Ron Johnson. I said this is a national security concern and it is. And it continues to be.

[01:08:20] Del Bigtree

Wow. Alright. So let's look at these numbers you've got coming out of UK because I think this is sort of gives us an understanding of what we're really dealing with.

[01:08:31] Edward Dowd, phinancetechnologies.com

Yeah. So what you're looking at is the percentage clearances. Oh, those are the absolute numbers. But I have the percentage clearances.

[01:08:39] Del Bigtree

So just really quickly, let me just show this. I just want to show this since we're looking at it, folks. When you look at the years, these are just all the different illnesses that have been reported. I think, and the actual hard numbers right? You have the disabilities, the disabilities, you have the averages there are 2016 to 19 at 485,000. I think that is look at 2020, it stays about the same. 2021, it ticks up. Okay. Now, we got hard Covid in there, 585,000. But look at 2022. It just skyrockets. That makes no sense. If you believed vaccines work, if you believed that we were supposed to be making ourselves healthier and safer, something went catastrophically wrong in 2022. That blew my mind that number. It was mind blowing.
Edward Dowd, phinancetechnologies.com

Yeah, let me just describe this data set. So this is this is a government disability system and you put in a claim and on average, 40% of the claims are cleared. That's what a clearance is. You get paid, you get paid by the government, 60% are denied. That ratio has stayed the same throughout Covid. There was and we disclosed this in our report, there was a problem during Covid of approving the clearances that got up to a high of 24 weeks average declare a claim in August of 2021. It came down to 16 weeks for 2022. And then as of Jan 23, it's 14 weeks. So the data in 2022 is pretty clean. 2021, there might be some issues, but the bottom line is something has gone horribly wrong in the UK and the disability system. So first, is it systemic fraud? If it is, the UK government should pay us that finance technologies, a big fat consulting fee we just uncovered the biggest fraud ever. If it's not fraud, what is it? I believe it's the vaccine. But if it's not the vaccines, what is it? Why aren't you talking about it? Because if you don't address this, your pension system will go broke. These numbers accelerated in 22. We can't wait to get our hands on the data that comes out soon for the up to date 23 numbers. So this is the standard deviations above the trend, the the total, the trend.

Del Bigtree

So really quickly, explain to me what a standard deviation is. What does that mean?

Edward Dowd, phinancetechnologies.com

So there's what's called an average. And around the average there are occurrences that come up over time. And it's a normal distribution curve. A one standard deviation is pretty normal to standard deviation. Okay. That's deviation from the average. Three is when you start to get pretty excited on Wall Street and in science land, that's an anomaly. It happens 0.3% of the time. That's three standard deviations. What's gone on in the UK system? Total body systems all across the spectrum, 34 standard deviations on an annual basis. Now on a monthly basis, that would come down because there's more occurrences. But you know, who cares? 34 is what we call Black swan event. That's like as likely as a black hole appearing off the orbit of the earth, swallowing us in a year.

Del Bigtree

Geez. Wow.

Unless something's changed, it happens. If something's changed. So something's changed.

Del Bigtree

Right. Right. But so is a gigantic change. Alright, here we have another one. This is Excess Clearance Z score age group. And now we're at 61.4. Standard deviation. Hematological.

Edward Dowd, phinancetechnologies.com

Yeah, so this is Hematological. So 61 standard deviations above the the trend that we identified, the four year trend. And then percentage wise, that's 555% in 2022 over trend excess over trend and hematology. Again, on a monthly basis, the standard deviation will come down. We have that data available as well. That's 25, 25 standard deviations, but still 25, 61. It's this is a joke and hematological. Again, we're not doctors. We don't pretend we're doctors. We're just giving this data. And we called on scientists and doctors to explain this. We tried to say, hey, if it's not the vaccine, what is it? This needs to be investigated. The regulatory authorities at least need to admit this is going on and it's devastating. This is a disaster. And we suspect what we're seeing in the UK is definitely happening in the US. If we had access to that data, we'd probably see similar numbers. There are some organizations working on getting that data and there's four FOIA requests and we hope they get it. Give it to us. We'll, we'll do what we did with the UK.

Del Bigtree

So what do you are as you sit there looking at the world as I am, what do we do? What do we do? It does it is really starting to get eerie, planes being canceled. It's to the point now, if it's within a five hour drive, I'm just going to drive because I can't risk missing an event because my planes are getting canceled. I keep hearing and it's always now it's just there's not a pilot. We don't have a pilot. We don't have the staff. We don't have a pilot. I mean, it's just it's.

Edward Dowd, phinancetechnologies.com

Yeah, yeah, it's paperwork. Oh, we have to check off on some paperwork. It's all lies. And it's getting it's affecting the health care system as well. We're going to drop a study on the NHS. That's the UK health system and their absence rate and work time loss, which is very similar to the general population. So health care is collapsing. You won't ever see the headline, but you'll hear the anecdotes. For instance, on Maui, someone went to the emergency room, I heard a story and they didn't get seen for 13 hours. You could fly to Australia from Honolulu in 13 hours. So it's either get serviced at the emergency room on Maui or go to go to Australia. Sydney, this is a joke and that's only going to get worse. You could, you know, in a year it'll probably be you could go to Sydney and back and still make your emergency room appointment. This is where we are. And, and it's, it's going to affect our economy for years to come. We're going to have to take precious resources and wealth to take care of the disabled and the sick unless we have a come to Jesus moment. We have some adults in Congress that call me Doctor Malone. Peter McCullough, you others to testify so that we can then address the problem, which is your immune system has gone haywire. That's why it's presenting in so many different fashions. Cancers are now starting to pick up. In 2022, There they were.

Del Bigtree

We have that here. Look at this. Look at the kids here, folks. There's the cancer that we're seeing, 15.9 standard deviation rise in the data coming out of the UK.
Edward Dowd, phinancetechnologies.com

I looked at I looked at just one age category under you can go into the total cancers, the human system. Then we have the underlying causes. We have breast cancer in the data. I just looked at 25 through 29 and I saw breast cancer was up 174% from trend in 2022. Now, is that normal? Do women normally get breast cancer at such a young age or is that I'm not a doctor? Maybe a doctor could answer that. For me, it was something it was something like 17 standard deviations. So, you know, we're you know, we're asking for help. We don't pretend we're doctors. And this data is free and available for all doctors to use. And please explain write papers. You know, you can't debunk the data, but you can you can certainly you can come up with your reason as to what's going on there.

[01:16:09] Del Bigtree

You're absolutely right. And this is the issue is that what we're saying is there is a crisis going on. We have a major problem. We can't fix it if we can't address it. And I think about the billions and billions of dollars, $10 billion spent just to promote the Covid vaccine on news channels in America, how about we get together, say we have a problem, we have an autoimmune disease crisis. We have a cancer crisis. We have a blood clotting crisis. We have a stroke crisis. And we've got to figure out what's going on. How about a few billion dollars in the people that have been calling this out and predicted this to begin with in that think tank? As we figure out how do we heal these people? How do we get people back up and running and into the workforce instead of turning a blind eye? It's really always it's always so interesting to see it from your perspective because, you're just you're not attached to the medical side of it the story. You're just crunching numbers as you would. Are there going to be financial advantages to some people that are studying this? Is anyone, I've asked you this before, but what does this do to markets?

[01:17:18] Edward Dowd, phinancetechnologies.com

Well, eventually the asset markets are going to figure this out. We're in the process of that, probably starting to happen this fall. There's going to be a global economic collapse because of this. Health care is going to become scarce. People are going to get sick. Productivity will drop. Productivity is one of the biggest drivers of our economies. Demand will drop. So it's coming. It's called deflation. And Carlos Alegre and Yuri Nunez, my two partners and I, Carlos, put out a paper saying that deflation is coming. That's what we're seeing coming in the first and second quarter of next year. So all this inflation talk will be replaced with deflation talk and deflation is a credit contraction, a destruction of credit and a slowdown in economic activity. And, you know, I suspect this is so bad and this what's gone on is so bad that the powers that be needed, distraction to cover this up. And that's usually war. And unfortunately, Warren Buffett agrees with me. He sold his Taiwan Semiconductor stock in the first quarter and he actually highlighted war as one of the reasons he got out of the position.

[01:18:24] Del Bigtree

Wow. We just we need a distraction at that level. This headline just came in. When we think about the myocarditis and the issue with our youth, look at this. This is a study "sex specific differences in myocardial injury incidence after Covid 19 booster vaccination." And it says this “in conclusion using active surveillance mRNA 1273 vaccine associated mild transient myocardial myocardial injury was found to be much more common than previously thought. It occurred in one out of 35 people.” It's unbelievable that 1 in 35 of the millions and millions have got that have gotten this vaccine, swelled their heart and they're saying, "oh, it's not a big deal. Don't worry. It's a light swelling of the heart, if you will."

[01:19:12] Edward Dowd, phinancetechnologies.com

Mild,

[01:19:13] Del Bigtree

Mild, just.

[01:19:14] Edward Dowd, phinancetechnologies.com

They call it mild. I've talked to doctors. There's no such thing as mild myocarditis. So that's that's just marketing spin from the propagandists as far as I'm concerned.

[01:19:24] Del Bigtree

And we've got this this last this is the last slide we have for you. This is the cardiovascular. We are at 19.3 standard deviations above normal, and the ones that scare me, really what's scary is these sort of strokes, we're starting to see the blood clots, but especially cancer. These are things we wouldn't have seen early on. These things take a little bit of time to develop. I'm really worried that we're just going to start seeing an acceleration there, who knows?

[01:19:59] Edward Dowd, phinancetechnologies.com

Yeah. So the the cancer numbers were this in 2020 cancers went up in the UK Pip system 1.78%, 6.4% in 2021, 35% in 2022. And that's that's what we call an acceleration. And this is a growth stock chart. I would be buying this hand over fist, expecting it to continue to pop higher. That's unfortunately what I see.

[01:20:22] Del Bigtree

Wow. What is the best way to follow the work that you're doing so that we can check in and keep track and all that stuff?
Edward Dowd, phinancetechnologies.com

Yeah. So our website is financetechnologies.com. We have all of our reports there under the Humanities project tab. And then you go to projects we have all cause mortality by different countries. We have we analyzed the Pfizer clinical trials, we look at disability data in the US and the UK now. We have absence and work time loss reports. We look at VAERS and the hospitalization rate. So we really want to what we're investors and investors. You have an analyst mosaic. Our thesis is the vaccine is causing this damage and the mosaic and the reports we drop are basically a preponderance of the evidence that at this point, anybody with any kind of like critical thinking skills would say, you know, these guys are on to something big here. I mean, we you know, we you know, we're not doing double blinded studies vaccinated because we don't have the money, nor would that get approved. But, you know, if this was Wall Street and this was a stock, we would be right and early and we'd be thumping our chest. But unfortunately, this is tragic and we're trying to get the adults in the room to stop this whole the vaccines and talk about healing the damage. And until we do that, this tragedy is going to continue to grow.

Del Bigtree

What's amazing about when I think back, no matter what anyone thinks, you made these predictions a couple of years ago as this started. We've been following you. And everything you've said so far is aging well. It's a horrible reality, as is the things that we've stated here on the Highwire. I think that we've got to start looking at the people that have been getting this right. I think in many ways we should be canonizing the Peter McCullough's and Robert Malone's and these doctors and scientists that put it all on the line have had their licenses under attack for stating what was obvious. And these were top medical professionals. It is clear they had it right. And the rest of the world got it wrong. We better figure out what's going on here. Edward Dowd, go ahead. What was your last thoughts?

Edward Dowd, phinancetechnologies.com

I just wanted to say all those people are heroes when they got canceled. I'm just a curious person, like a moth to a flame. I went and read everything they said and it resonated with me. And I was lucky enough to meet Dr. Malone on this island. And my journey started. I said, I'll look at the financial side of this, the insurance companies and the funeral homes. And from there I built a team. So I think these guys deserve to be canonized. You know, they they did put it all on the line. So I just appreciate them and you people like you and others. So this has been a team effort to get the truth out there. And I think we're winning slowly because word of mouth is spreading. I'm going to put out on Twitter soon our website traffic. It's really starting to take off now. I'll show you eventually, like when we started and it's really accelerating. So word of mouth is spreading. Thank God.

Del Bigtree

That's good to hear. Thank God. Lots of work to do. Glad to know you're out there and I look forward to seeing you again soon. Thank you for taking the time to bring us this very important information this week.

Edward Dowd, phinancetechnologies.com

Thank you, Del.

Del Bigtree

Take care. Alright, folks. Well we've got to wake up the world. One of the ways we're doing it is through books and reading. ICAN has our own press right now. We have two amazing books right now. If you don't have these, you should. "The War on Ivermectin." And "I'm unvaccinated and that's okay." We just talked about this last week. It's skyrocketing book sales. But all of these are available at ICAN the ICAN bookstore but this is what our press company is all about. Take a look at this.

Del Bigtree

At the Informed Consent Action Network, we are always working hard to inform, educate and bring you the truth. That's why I'm excited to announce our new book and publishing division. ICAN press. Leveraging the power of the written word. ICAN Press is partnering with dynamic writers, medical professionals, and experts dedicated to the truth, building a library that will captivate, empower and inform you and your family. ICAN press has already launched The Informant, an online monthly magazine creating news from ICAN and The HighWire offered exclusively to our recurring donors. Sign up for the informant at ICANdecide.org/theinformant now ICAN press is bringing you two must have books first the War on Ivermectin from author Dr. Pierre Kory details the relentless attack on a decades old Nobel Prize winning medicine that could have ended the pandemic. "The War on Ivermectin" is available now. Also available, "I'm unvaccinated, and that's okay" A children's book by Dr. Shannon Kroner, which empowers parents to talk to their children about the decision to not vaccinate and how to navigate any negativity they may encounter out in the world. By these must have books wherever books are sold and that ICANdecide.shop. Start building your library from ICAN press today.
[01:25:11] Del Bigtree
Well, I want to thank all my guests. Edward Dowd, Jefferey Jaxen, who just keeps rocking out every single week. I just want to let you know there's a great event happening next weekend in San Diego, and that is the spellers. We've talked about this. This is that new communication concept that's being used by those that are suffering from or are on the autism spectrum so that they can actually communicate. There's a charity golf. This is a par three. It's a lot of fun, barbecue, all of that. If you want to join an Oceanside, that's where it's taking place, where one of the big supporters and presenters there. It'd be great to see you out there supporting a really great cause. And of course, all the information will be available to you right here in the comments. We will also have it available to you. But be a sponsor, get involved. Ohana is really working to sort of build a space a day space where children and adults on the spectrum can experience life in a grander way and maybe work towards more independence, something that we are really excited to be a part of. So next weekend, Ohana, is putting on this incredible golf event, the charity golf event, August 4th. You can get your tickets today. Just go to spellers.Freedomfoundation.org/ohana-golf. I just want to say, sometimes it can seem grim. It is really hard to watch all of these stories out there of beautiful people, young athletes, that that's lives are being changed, possibly forever.

[01:28:18] Del Bigtree
So much more to discuss here. But I want to thank all of you that support the work that we're doing. I want to thank you because you are sharing this show. You're sharing our books so that we can spread the word. That is how we make a difference. If we just sit here and keep the information to ourselves, then I think we just get depressed. If we take this information and go out and help wake people up, you'll get to see how good it feels when you realize that a light bulb just went off. I'm lucky to have that experience on an almost daily basis, but it's it's possible for all of us get out there, share the truth, do it in a nice way. Be kind. These are scary times. Try not to just scare somebody with shock value, but lead them to the light. It is the moment that we need right now. We need that light. We need a better world. And we are a part of making that happen here at the Highwire. And I want to thank you because really, it's just one person, one show. It's when you share what you learn, when you share what you know, when you courageously speak out, that's when the world listens. That's when the world becomes a better place. I want to thank you for your courage. I want to thank you for being a Highwire supporter. Thanks for watching. And we'll see you next week.

END OF TRANSCRIPT
