

NAME

EP 427 6/5/25mp4

DATE

June 6, 2025

DURATION

1h 32m 33s

43 SPEAKERS

Del Bigtree, Host, TheHighWire.com

The HighWire Control Room

Jenn Sherry Parry, Executive Producer, The HighWire

Simon Evans, Host, GBNews.com

Leo Kearse, Comedian

Paul Cox, Comedian

Jefferey Jaxen, Investigative Journalist

Barack Obama, 44th US President

Jerry (kid in classroom)

Various kids in classroom

Dr. Anthony Fauci, Former Director of NIAID (1984-2022)

Sanjula Jain-Naggpal, PhD, Associate Director of Policy & Research Strategy

Vinayak Kashyap Prasad, MD, MPH. Director - Center for Biologics Evaluation and Research

Marty Makary, MD, MPH, FDA Commissioner

Prof. Heidi Larson, PhD, Professor of Anthropolgy, Risk and Decision Scientist, Director, Vaccine Confidence Project

Jasleen Chaggar, Legal & Policy Offer, Big Brother Watch, May 31, 2025

Peter Kyle MP, DSIT Secretary

BBC News reporter

Various news reporters

John Oliver

Rush to Green Energy speaker 1

PBS News reporter

Fox News reporter

Rush to Green Energy speaker 2

Rush to Green Energy speaker 3

Rush to Green Energy speaker 4

Speaker 1, The Agenda

Speaker 2, The Agenda

Speaker 3, The Agenda

Catherine Austin Fitts, Former Assistant Secretary of Housing and Federal Housing Commissioner at the United States Department of Housing and Urban Development, Former Managing Director and Member of the Board of Directors of Dillon, Read & Co, Inc, President of Solari, Inc.

Speaker 4, The Agenda

Speaker 5, The Agenda

Speaker 6, The Agenda

Speaker 7, The Agenda

Speaker 8, The Agenda

Speaker 9, The Agenda

Speaker 10, The Agenda

Speaker 11, The Agenda

Speaker 12, The Agenda

Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Speaker 13, The Agenda

Bill Gates

Jillian Michaels, American Fitness Expert

[00:00:06] Del Bigtree, Host, TheHighWire.com

Have you noticed that this show doesn't have any commercials? I'm not selling you diapers or vitamins or smoothies or gasoline. That's because I don't want any corporate sponsors telling me what I can investigate or what I can say. Instead, you are our sponsors. This is a production by our nonprofit, the Informed Consent Action Network. So if you want more investigations, if you want landmark legal wins, if you want hard-hitting news, if you want the truth, go to icandecide.org and donate now. All right everyone, are we ready?

[00:00:45] The HighWire Control Room

Yeah.

[00:00:45] Jenn Sherry Parry, Executive Producer, The HighWire

Let's do this.

[00:00:47] Del Bigtree, Host, TheHighWire.com

Action!

[00:01:01] Del Bigtree, Host, TheHighWire.com

Good morning, good afternoon, good evening. Wherever you are out there in the world, it's time for us all to step out onto The HighWire. You know, a lot of times, especially lately, I've been talking about how America feels like it's this sort of island of sanity while the World Health Organization and the WEF appear to be like beating down the world and the world is giving in. We're just seeing all sorts of authoritarian measures all around the world but, you know, we're going to be talking about some of the sort of facial recognition software and tracking systems and real IDs like worldwide, but also we're seeing people arrested in England and Ireland for simply just posting a meme that the government doesn't agree with. I mean, it's getting really scary out there and the World Health Organization, everyone seems to be signing up and signing over their sovereignty. But just when I thought it was getting really bad, I saw this.

[00:01:55] Simon Evans, Host, GBNews.com

Vaccine hesitancy now, Leo, in the times and the latest demographic to doubt their efficacy are doctors and nurses.

[00:02:02] Leo Kears, Comedian

Yeah, who'd have thought it? So the NHS has a vaccine problem. Staff don't want the jab. So doctors, nurses, and other frontline NHS staff are shunning the flu vaccine --this is the flu vaccine, not the coronavirus vaccine-- in ever greater numbers, with almost 9 in 10 staff at one of England's largest hospital trusts and unvaccinated last winter. I wonder what changed in the last five years to make people suspicious of vaccines.

[00:02:27] Simon Evans, Host, GBNews.com

It's called, they're acknowledging as much as vaccine fatigue. They're just, we're just a bit tired of vaccines. We don't believe it was all a load of propaganda and nonsense and statist reruns of a possible home arrest.

[00:02:39] Leo Kears, Comedian

Long vaccine.

[00:02:40] Paul Cox, Comedian

Even relative normies like myself, who did have a Covid jab, much to Nick Dixon's disgust, you know, I've become very suspicious because when they, when they mandate stuff, when they say, if you don't do this you will be in trouble, you start to ask why. Up until that point, you know, vaccines were given to us at school, if someone said you had a vaccine to go on holiday, I just went along with it.

[00:03:03] Del Bigtree, Host, TheHighWire.com

I know we're all suffering from the end time vibes at times, but it's just things like that that have to make you realize, you know what, humanity is not that stupid, and the genie's out of the bottle. We all went through it around the world. We went through it with the COVID lockdowns. Everybody with blood moving through their veins knows that the entire thing was a scam. Social distancing was made up, masks don't work, the vaccine can't stop transparency, and by number ten booster shots, that apparently is clear to everybody. So, you know, and they're not even talking about the COVID booster there, they're talking about the flu shot. Nine out of ten hospital workers in the NHS are saying that they're not taking the flu shot. Well, that's, what's that going to do for flu shots. And by the way, what do you think that's going to do to the global agenda the next time the W.H.O. tries to mandate that everybody line up for another experimental vaccine because some new virus or bacteria is roaming the Earth. I think that we have turned a corner. We've got to stay positive and recognize that we are not alone. They want us to feel lonely. That's how it kicks in, that's how we start reacting, that's how they start controlling us. So really good to see news reports coming out of England of sanity. So we're not alone here in America. And for those of you around the world, we're going to keep saying the same thing I'm saying here.

[00:04:19] Del Bigtree, Host, TheHighWire.com

Use your voice. Speak up. Speak your truth. We're winning this. We've got to keep moving the masses. And every once in a while we get lucky. The masses even infect the television right in front of our eyes. We're going to be talking a lot about the new developments with vaccines here in America. What's approved? What's not approved? Should we be happy? Should we be sad? All that coming right up with the Jaxen Report, but first I want to just talk about my next guest that's going to be coming up later on in the show. Mark Sharman worked in England. He worked as a top executive for television. He has a brand new documentary that's coming out, and it is really shocking, really mind-blowing, and boy does it put it all together in a way you haven't seen before. It's called The Agenda. Their vision is your future. Uh oh. I can't wait to talk to you about that but first it's time for The Jaxen Report. All right, Jefferey, it can be really easy to feel like you're in an alarmist mood right now. I mean, we got, you know, wars breaking out all over, it feels like everyone's at each other's throats, but, you know, there's still so much, I think, to be happy for. And, you know, we got to celebrate the little battles, don't we? The little wins here and there.

[00:05:37] Jefferey Jaxen, Investigative Journalist

Yeah, yeah. You know, it seems like only yesterday that the COVID pandemic was over and we were celebrating because that was finally behind us, and we're seeing now new headlines coming out that say this. "As new Covid strain from China hits the U.S.... some experts are calling for FACE MASKS to return." Good luck with that, experts.

[00:05:58] Del Bigtree, Host, TheHighWire.com

Groundhog day.

[00:05:59] Jefferey Jaxen, Investigative Journalist

Good luck. So this is a new strain they're saying China, Hong Kong, Thailand they're seeing it there. They're seeing it, some of it in the United States from international travelers coming into California but the prevalence isn't even close to high enough for the CDC to even be tracking this. So it looks like in the US, this is not really a big thing. But I want to remind people, to take this moment to remind people, what our health officials were doing when we had a COVID pandemic here and there was a vaccine rollout. If anybody didn't see this clip, I think this is kind of emblematic of that entire moment in history. Take a look.

[00:06:33] Del Bigtree, Host, TheHighWire.com

All right.

[00:06:34] Barack Obama, 44th US President

Hi, everybody. Good to see you guys. What's going on? My name is Barack. What's your name?

[00:06:44] Jerry (kid in classroom)

Jerry.

[00:06:44] Barack Obama, 44th US President

Jerry. Doctor Fauci, he's very important. He helps to run all the stuff to keep people healthy, you know? Do you guys know why we are getting these shots? What do you think?

[00:06:58] Various kids in classroom

So we can be protected from the COVID?

[00:06:59] Barack Obama, 44th US President

That's exactly right.

[00:07:01] Various kids in classroom

What is the vaccine made of?

[00:07:05] Dr. Anthony Fauci, Former Director of NIAID (1984-2022)

Ah. That's a great question. The vaccine takes a part of the virus that can't hurt you, a little nub that's on the. If the virus is like this, there's a little thing that sticks out here, it's called a spike. So you take this spike, you put it in the vaccine, you give it to you, and your body thinks it's the virus, but it isn't. It's just a part of the virus. So your body makes a really, really good response against it, so that when the real virus comes along, your body's ready to just knock it out.

[00:07:36] Barack Obama, 44th US President

The older you get, when you when you get COVID, the more dangerous it is.

[00:07:40] Dr. Anthony Fauci, Former Director of NIAID (1984-2022)

Like an old guy like me. You guys are protecting me by not getting infected.

[00:07:43] Barack Obama, 44th US President

That's exactly right.

[00:07:44] Dr. Anthony Fauci, Former Director of NIAID (1984-2022)

You're protecting me. You really are.

[00:07:47] Del Bigtree, Host, TheHighWire.com

I mean, that video is all kinds of wrong. I mean, you know, first of all, talking about the vaccine takes the spike protein, which is the part of the virus that can't hurt you. Here's a newsflash. Uh, you know, obviously, we all now know it is the bioweapon of the virus and is what is absolutely going to swell your heart or cause thrombocytopenia or stroke or all the other beautiful things this vaccine is capable of. But then, you know, right there, classic. And we're going to use you little children as Operation Human Shield for the elderly. Something we've never done before, just sacrifice children so that Tony Fauci can be safer. Uh, man, it's, uh. Didn't age well.

[00:08:32] Jefferey Jaxen, Investigative Journalist

Shaming school kids because the vaccine wasn't even tested to stop transmission at that point but, hey, what do the school kids know? They're not going to fact check them. So I want to take this opportunity to just talk about some of the aftermath from the pandemic. And this is the, this is just this week in the headlines here. "Doctors sound alarm over massive spike in Americans suddenly dropping dead from unexplained heart attacks." This is out of Massachusetts. I want to show a graph from this article. This is the cardiac mortality rate per 100,000 Massachusetts residents. And you can see there, the dotted blue lines are what they expected, and then the yellow line is what they observed. And you can see, curiously enough, around 2020, 2021, and 2022 when the vaccine rollout was happening, you see this gigantic spike of cardiac mortality rates. Terrible. And same thing. New York Post here, "Why are so many people having strokes in their 20s, 30s and 40s: 'We've never had patients so young,'" say the doctors quoted in the article. So these are the conversations that are surrounding this, this experimental vaccine rollout. And in that space, we have this headline, which is causing a lot of conversation online. "FDA approves Moderna's new...COVID-19 vaccine." And this is the latest in the FDA's approval. This is for 65 and older and then also 12 to 64 with underlying risk factors that we talked about in the show when you and I were in D.C.. So a lot of, you know, a lot of the public is looking at this kind of with mixed feelings. And I want to go right into the FDA insert for this Moderna vaccine. It's called MNEXSPIKE, because apparently the first spike wasn't good enough so we're going to go to the next one.

[00:10:10] Del Bigtree, Host, TheHighWire.com

We haven't learned our lesson by taking the most dangerous part of this virus and making a vaccine out of it. Look, I have not vaccinated my kids, let me be perfectly clear with everyone in this audience, so, you know, take my opinion with the understanding of that bias. I wasn't vaccinated as a child, but my understanding of vaccines was the idea to do exactly what Tony Fauci said, which is to take the weakest part of the virus, you know, use that as your vaccine. So just in case something goes wrong and it proliferates throughout your body or inserts itself in your genetic code, that at least it won't be something really harmful. But the spike is literally the worst part of this virus. Why are they still making vaccines that are taking the worst part, the most dangerous part. It's absolutely mind-blowing. It's like they want to kill people.

[00:10:57] Jefferey Jaxen, Investigative Journalist

And as we know, that that message goes into the cell, it kind of uses, hijacks the cell's machinery to create these spike proteins. And we're going to go into that a little more down the road in this segment. But let's go to the FDA's, basically their insert for this vaccine. Every vaccine has one of those, including this MNEXSPIKE. And it looks at the trials that were used, the safety trials that were used for the FDA to give the nod to this and say, that looks okay, we can give it to 65 and older and those with risk factors. And here's the first one. I'm going to go quick on this. But it says, "The safety of MNEXSPIKE was evaluated...." So they did do a "randomized, observer-blind, active-controlled clinical trial in the United States, United Kingdom and Canada...." But then you go down a little further and what did they compare it against? A comparator vaccine that is the Moderna vaccine with the original and Omicron strains. So an older Moderna vaccine was the comparator. And then another safety study goes into that and it also says, this was done in Japan, and the comparator vaccine was the SPIKEVAX. That was their 2023, 2024 formulation. So no placebo control. And just for the caveat here, this is just like every other vaccine on the childhood schedule pretty much. They did not test this for carcinogenesis, mutagenesis, so that's cancer-causing ability. Impairment of fertility has not been evaluated. Genotoxicity, the toxicity to your cell lines. So that's nothing new but it may shock some people in the audience. So these are some of the questions people had. Where are the studies we were promised on this, and Doctor Marty Makary, the FDA head, and then Vinay Prasad, the CBER head, so these are the two heads of the FDA. They took to kind of like an online question format. And they posted this on X. Take a look.

[00:12:37] Del Bigtree, Host, TheHighWire.com

All right.

[00:12:38] Sanjula Jain-Nagpal, PhD, Associate Director of Policy & Research Strategy

So you mentioned something about the RCT. Can you just unpack a little bit more? So to approve this drug we did not require an RCT upfront, is that correct?

[00:12:47] Vinayak Kashyap Prasad, MD, MPH. Director - Center for Biologics Evaluation and Research

Well, the company did do randomized control trials, but they tested their new product, MNEXSPIKE, against their older product, Spikevax, and we at FDA felt that that was sufficient to allow this product to be available to the vulnerable people, older people, and high risk people. But, as we have said all along, and we're going to stick to and they are going to fulfill their commitments, we want to see a randomized controlled trial of people between 50 and 64 who are healthy Americans to show me these vaccines are doing what we hope they're doing, and what we think they might be doing but we don't know for sure, and we want to see that in this age group where there's something, what we call global equipoise, means that you look across all the countries in the world, people are genuinely unsure if the vaccines work in that age group. Some countries recommend it, some don't. We want to see proof that it works. And again, they're not going to go up against another Moderna product in this study. It's Moderna vaccine against a saline placebo. We're going to see all the adverse events in this study, we're going to see whether or not it helps people, and what it does, and whether or not it's working like we think it might be in 2025. You know.

[00:13:52] Marty Makary, MD, MPH, FDA Commissioner

I think a lot of people are going to be interested in the results of that trial, because I think it's an honest unknown, it's a scientific unknown. And so when you get into that group that you described, the 50 to 65, I mean, France, you got to be 75 or 80, actually 80 in France, 75 in the UK....

[00:14:08] Vinayak Kashyap Prasad, MD, MPH. Director - Center for Biologics Evaluation and Research

80 in France, 75 in the UK.

[00:14:09] Marty Makary, MD, MPH, FDA Commissioner

...or high risk. I think a lot of clinicians, a lot of moms, a lot of people out there in the world are wondering, do, you know, does the risk-benefit ratio favor getting it at this point? So I think a lot of people are going to be interested in that result. So I mean, let's be honest, the numbers suggest there's either a lot of skepticism, uncertainty, distrust, but 85% of health care workers did not get the last COVID shot, and somewhere between 12 and 13, 12 and 14% of kids got the last COVID shot. So that means for 87, 88% of parents, for 87, 88% of kids, their parents said, no thank you to the last COVID shot. So I think you're going to answer some really interesting questions, a lot of people....

[00:15:00] Vinayak Kashyap Prasad, MD, MPH. Director - Center for Biologics Evaluation and Research

It's such a key study. And I think there's another misconception I want to clarify, which is people have said, you at FDA are recommending this shot to high-risk people and older people. I want to be very clear. The FDA is not your doctor. We are not, we don't recommend shots to people. What we do is we make them available for patients to have a conversation with their doctor. But I can understand a 66-year-old who goes to see their doctor, and they may decide to do it or not do it, that's their medical decision. FDA is granting a marketing authorization for that, but we are not in the business of making recommendations. That's other agencies and other bodies.

[00:15:36] Del Bigtree, Host, TheHighWire.com

I mean, let's, let's certainly have a moment here, Jefferey, to recognize that we have, you know, from the moment I made the film VAXXED and released that in 2016, one of the battle cries that we've had, you know, throughout this movement, whether it's medical freedom or now MAHA, was we want placebo-based trials for vaccines, just like there are for drugs. And for the first time in history, not just Robert Kennedy Jr, but you're watching head of FDA, head of CBER right now discussing, you know, having placebo-based trials. So we are definitely moving into a direction we have never been before. There's no way we're here without Robert Kennedy Jr so all of that's very exciting. But I know you're about to discuss a lot of the complaints about, well why did this thing get approved without that to begin with? And Vinay Prasad makes an interesting point, saying, look, we are not recommending, it's not what the FDA, you know, does. We are just saying it's approved to be on the market and now your doctor can have the conversation with you. And as soon as he said that, I said, that is really at the core of this problem, is exactly that. If your doctor is having the conversation, what kind of conversation are they having and what do they actually know? And I reflected back to, do you remember in 2019, right before COVID, we did a whole show on the W.H.O. meeting in Geneva, Switzerland, where they all got together to discuss how to stop vaccine hesitancy. And Heidi Larson talked about the education. She's the lead psychologist for the W.H.O. When she said, how equipped are doctors to talk about vaccines? This is what she had to say.

[00:17:12] Prof. Heidi Larson, PhD, Professor of Anthropology, Risk and Decision Scientist, Director, Vaccine Confidence Project

We've talked about it earlier. Some of the challenges are when the frontline professionals are starting to question, or they don't feel like they have enough confidence about the safety to stand up to it, to the person asking them the questions. I mean, most medical school curriculums, even nursing curriculums. I mean, in medical school, you're lucky if you have a half-day on vaccines, nevermind keeping up to date with all this.

[00:17:43] Del Bigtree, Host, TheHighWire.com

That was such a mind-blowing statement for everyone in the world except you and I. We had been reporting on that for years. It was called misinformation. Doctors are not trained on vaccines. They don't know them folks. They don't understand them. They don't know the immune system. You ask your pediatrician, they don't really know how these things work. They don't know what's in them. They got a half a day education, as stated in front of an international panel. So now when you think about the FDA making it available so that you can have an educated conversation with your doctor, well, how are you having an educated conversation if your doctor's not educated, and how educated is the person going to be that's going in and trusting their doctors? So there's still so many places this thing falls apart. But I do want to point out, at least we are having the conversations, you know, Vinay says there. It's not going to be a Moderna against Moderna, no that's a bad thing, which we know it is. It's going to be against a placebo in the future. Anyway, just I think very interesting points and obviously very strong heated conversations about all of this right now.

[00:18:46] Jefferey Jaxen, Investigative Journalist

Right. And he mentions Prasad, Doctor Prasad mentions, we want to see what the benefits are. That would be helpful because we've been given this thing for four years, at least. And this actually sets up the CDC to step out and revolutionize itself. I mean, this is like a slow pitch to a home run hitter. The CDC could hit this thing out of the park and say, you know what? No placebo control, no recommendation. Sorry. And that, so that's another option here. But the big question, when they say, because the FDA pulled the recommendation or I'm sorry, pulled the, the license or whatever for kids, for children, for healthy children. Yeah. Because that wasn't effective in that age group. But if you look under the hood of that, that statement, it wasn't effective, but it was causing some harm. And so when this vaccine is put forward to 65-plus and those with underlying conditions, the question is, what about that myocarditis and those heart issues? So we look at the biological license application that the FDA has, the letter the FDA sends to Moderna and says, you know what? You got the green light. Go ahead and do it, but we're going to give you some homework. And this is some of the homework they gave them. They said, we want post-marketing retrospective cohort studies looking at the occurrence of myocarditis and pericarditis. But here's one of the issues. The final report submission, way at the bottom there says 2029. And then it goes on to say we want you to do another thing.

[00:20:05] Jefferey Jaxen, Investigative Journalist

We want you to look at the long-term issues of that vaccine-induced myocarditis. But we're going to give you to 2034 to look at that. So these are the questions. And so that's why these placebo-controlled trials are so important because we know on the backend, the PREP Act is extended to 2029. That's still protecting these vaccines for legal liability. The vaccine injury compensation is not adequate. So on the back end, these people that get injured from these vaccines are getting no relief, so that some type of revolution has to happen in that space as well but at least on the front end, we need to be seeing these placebo controls. So Kennedy, Secretary HHS Kennedy did step out onto X and posted this, addressing the public's concern. He said, "I want to address those of you who have anxieties about @US_FDA's limited approval of the new mRNA COVID vaccine for high-risk populations. Moderna has agreed to a true placebo-controlled trial of the new vaccine," --just like Prasad said-- "which is similar to the existing mRNA vaccine but uses a smaller protein. The FDA will monitor and collect data throughout the trial for every adverse outcome -- not just a table list of expected outcomes. FDA will scrutinize every aspect of the trial. We will deliver on our promise to use gold-standard science and common sense." So in my view, these are positives, small for some people but these are positives because you want your HHS secretary directly communicating to the public when there's concerns. You want Prasad, you want Makary.

[00:21:29] Jefferey Jaxen, Investigative Journalist

You want these doctors stepping out and directly communicating concerns, even though they might not be giving the answers everyone likes. This is how you want. You want to hold their feet to the fire, so they have to keep addressing these concerns as opposed to every other administration in our lifetime just kind of moving along, rubber stamp, business as usual. At the same time, the FDA is launching an AI, artificial intelligence. This was during the same week of all this controversy. It says today, this is on X. They said, "Today, the FDA launched Elsa...." And you go down into that bullet point list. What's this AI going to do? Well, it's going to accelerate clinical protocol reviews, it's going to identify inspection targets, shorten time needed for scientific evaluations, summarize adverse events to support safety profile assessments. So they have the tools here to do something with this AI if they really, if they really use it appropriately, and we hope they will to get these answers before 2034. And so these are the conversations with that mRNA platform. But we reported just a couple of weeks ago that Kennedy, HHS canceled a Moderna bird flu vaccine. That was kind of a relic, a leftover relic of the Biden administration, who gave hundreds of millions of dollars to this. This was a late stage, ready to go into circulation if given. Well, this came on the back end. This was in April. "FDA grants fast track designation for potential bird flu vaccine." And what's interesting about this one, it's only the phase one trial so it's really early, it's not late stage.

[00:22:50] Jefferey Jaxen, Investigative Journalist

It's really early into this. They're not expecting the results from that trial until the end of summer potentially. But the technology is another layer on top of this messenger RNA technology. So the messenger RNA traditionally for the COVID vaccines goes in, hijacks your cell machinery, produces copies of the spike proteins. This bird flu vaccine is what's called self-amplifying mRNA. So they have all the ingredients, all the machinery on their back when they get injected. They just need to get in the body. So this is a study looking at that. Now Japan has been doing a self-amplifying mRNA COVID vaccines already, so this has already been put out there, but this company is looking at this for bird flu. So we look at this study. It's a very small study. It's in Uganda. It's with 42 people. And they looked at the safety of this self-amplifying mRNA or RNA. And we look at the table here, and you can see, they're looking at grade three adverse reactions. So to give you an idea, grade five is death. Grade three is you probably got to seek some hospital, some hospital care. You might not be going to work. And you can see here, remember 42 people in the study, we have 13 basically reports of neutropenia, 16 reports of lymphopenia, and then eight reports of thrombocytopenia. So that's basically white blood cell counts, low white blood cell counts, low platelet counts. That's all affecting your immune system, and that's a big deal, so.

[00:24:14] Del Bigtree, Host, TheHighWire.com

I mean unless, you know, unless these people had all three of those things happen to them, which I would like to see teased out. I mean, even that is a horrendous numbers. Those aren't like 1 in 1,000,000. Those are like 50% to 90%, if those are all happening to singular individuals. What a horrendous trial experience that is. And yet that didn't shut it down in its tracks.

[00:24:38] Jefferey Jaxen, Investigative Journalist

Right. And again, these are given, these self-amplifying RNA proteins, and vaccines, are being given in other countries, but this is now the next generation for the bird flu conversation. So we're keeping an eye on that and I want to stick with some of the studies now, some of the studies that have been coming out, really have been groundbreaking. One of them is the sudden infant death syndrome. So babies are dying, young infants are dying, and people, the scientific community had no clue what it's called, or no clue how it was happening, so they just called it, well it's a syndrome, and it suddenly kills you. And we don't know what it is, and we don't really look for what it is too much and, when it comes to like, could it be a vaccine? Well, we don't look for that in the postmortem autopsies, we just assume it's just SIDS. We just put that label on it. So now we have a study, it's actually a systemic review of all the literature. And what is it looking at? Well it's looking at the immature infant liver, so it's really like zeroing in on one of these specific pathways, cytochrome P450 enzymes and their relevance to vaccine safety and SIDS research. So CYP 450, that's, it's called a superfamily. It's a gigantic group of enzymes that plays one of the major roles in detoxifying things from the body, like drugs, obviously toxins, but things in the vaccine like aluminum, polysorbate 80, this is all part of that pathway.

[00:26:01] Jefferey Jaxen, Investigative Journalist

And what did the researchers find? They said this. "Results: CYP450 enzymes exhibit developmental immaturity in infants and genetic polymorphisms." So just because they're infants they have this immature pathway, but some of them are genetically vulnerable. Then it says, this "may affect vaccine excipient clearance. While epidemiological evidence shows temporal clustering of some SIDS cases post-vaccination, causality remains unproven. Inflammation-induced suppression of CYP450 enzymes raise questions and potential metabolic vulnerabilities, which current postmortem protocols often fail to capture." So that's a lot of words saying, basically, when you can't detox these pathways, inflammation arises and it affects the baby's entire body. It causes perhaps a cytokine storm. That's actually in some of the literature they're looking at in the systemic review. And they are also saying that it affects the breathing pathway, the serotonin pathway, which is the autonomic nervous system, and that basically stops the breathing of these infants. So we have a potential pathway, and this is really interesting and it's exciting because this could, if this is, this will revolutionize the entire space of the SIDS conversation and really lead to some justice for parents that have been told, well, this is just what happens to some kids.

[00:27:19] Del Bigtree, Host, TheHighWire.com

Yeah, that's really amazing. I mean, that is actual breaking news. It's one of the biggest questions we have in the vaccine program. So many studies showing that, you know, the majority of SIDS cases happen within, I think, seven days of vaccination and now we're starting to see a pathway. Again Jefferey, I just, I want to point out that, as frustrated as we may be, we still have regulatory agencies that are starting to at least, you know, take baby steps into the right conversation, right questions. But look at what we've already said today. In, you know, in England you have nine out of ten health care workers aren't getting the flu shot. Here, 85%, Vinay Prasad, or maybe it was Marty said, I think Marty, 85% of healthcare workers in America are refusing the COVID vaccine. That means, as this science starts to come forward, you know, we've had a concern, will people recognize it, will they know what they're seeing? When you have 85% of the medical establishment not taking products because they're questioning it, they're going to be watching the science as it's coming in. They're going to be watching these double-blind placebo trials that have never happened before, and I believe, you know, we are going to have not just our bullhorn, it's going to be the bullhorn of modern medicine saying, hold on a second. I mean, you know, the right eyes are asking the right questions so, I mean, I feel very positive about it. If we can get there, right. As long as we don't have to wait till 2034. I mean, jeez, we could all be dead by then if we have to wait for results on those timelines, so hopefully that's something they get sped up so people can get some answers quickly.

[00:28:52] Jefferey Jaxen, Investigative Journalist

Right. And speaking of answers, let's stay on this COVID conversation here because, well, it was only the biggest story in the last 100 years when it comes to the psychological manipulation of the population, biological warfare. And so when it comes to the scientific literature, if you look across the literature, you'll still see the conversation that this originated from natural selection, a wet market in Wuhan. You don't talk about lab leaks. Even though the United States intelligence agencies, with their classified information that they've seen, say it is, the FOIA emails that we've read to you from the scientists involved, in Fauci and Jeremy Farrar have basically shown that that conversation, they knew something was up. But now we have actual researchers trying to get their evidence published in journals. One of them is Matt Ridley. He took to The Telegraph to tell his story. He says, "The scientific community is still censoring Covid heretics." And he said this. "Last year a prestigious scientific journal invited me and a colleague, Professor Anton van der Merwe of Oxford University, to prepare a scholarly paper summarizing the evidence that Covid began with a laboratory accident in Wuhan. We did so, writing a 5,000-word paper with 91 references. The journal summarily rejected it. We revised it and tried another journal: same result. And again... Part of the problem is anonymity..." he says. And he goes on to talk about how the peer review system is broken, and it's really more politics than it is anything else. He says, "Peer reviewers get to keep their identities secret, but the authors of the papers don't. That is a recipe for vindictive behaviour. By keeping heretics out of the literature, the dogmatists can then claim that there is no dissent and a 'consensus' has formed." So that consensus is still trying to hold the line that this came from a natural situation, as opposed to a lab leak or bioweapon gain of function research.

[00:30:39] Jefferey Jaxen, Investigative Journalist

So what did Matt really do? He couldn't find a home for his paper, so the Telegraph actually posted his paper and here it is, we're going to go through it. And they titled it, cheekily, "It's time for the truth. Here's the Covid Paper they don't want you to read." And here it is, it's called "The preponderance of evidence suggests that the Covid-19 pandemic began as a result of a research accident." So now it's in the scientific literature. And they concluded this. "In only one city in the world were sarbecoviruses subject to gain-of-function experiments on a large scale involving human airway cells and humanised mice at inappropriate safety levels: Wuhan. At only one time in history was researched to create novel sarbecoviruses with enhanced infectivity through furin cleavage under consideration: 2018 onwards." He said, "The surprising failure to find better evidence for a natural spillover, and the lack of transparency from the Chinese scientists, is therefore best explained by positing a laboratory accident involving a live virus experiment as the cause of the Covid pandemic and attempts to cover it up." That last line is speaking volumes. So that is what the scientific literature is actually pointing to, on top of intelligence agencies, their information on top of FOIA emails, we really have a clear target for our future here. So what's happening now? We need our government to really start pulling some of this funding. We saw that from Brooke Rollins, she's the head of the USDA.

[00:31:55] Jefferey Jaxen, Investigative Journalist

And there is still, there was still, I should say, bird flu gain of function research going on that the US taxpayers were funding in China with Wuhan-affiliated researchers. If you can't believe that, well, it's over now. Here's the headline. This is at White Coat Waste. They spearheaded some of this, or much of this information. And this is the canceling of that contract. She announced it. These are, again Wuhan linked experimenters with dangerous bird flu gain of function. And they were doing what's called max pain. So if PETA was nowhere involved in this, they should have been. But that's just basically letting, letting these symptoms run wild. And so that's over. But now when we're talking about China, it looks like with their funding, US taxpayer funding cut, they may be coming in the back door or through the border. And this is what's happening. "2 Chinese nationals have now been charged" by the Department of Justice "with smuggling 'potential agroterrorism' fungus into the US." These were people's, according to the DOJ, these are People's Republic of China allegedly receiving, they're citizens of People's Republic of China, they're allegedly receiving Chinese government funding for that research and some of it at the University of Michigan. So these are now caught. The good news here, obviously, is they're looking out. We have the Department of Justice, we have border officials, the FBI, they're looking out for these things. And you gotta question, how many happened, how much of this was going on before, before these two were caught. So now that there's an alert going on, this is a really good start in the United States.

[00:33:25] Del Bigtree, Host, TheHighWire.com

Yeah, but really disconcerting. I mean, you don't wrap your head around. You mean there's viruses someone can bring in that just, like, wipes out all of your crops and your food supply in America? I mean, scary, and who sent them and what's really going on there? Lots of questions, scary questions.

[00:33:43] Jefferey Jaxen, Investigative Journalist

And I hope we get to the answer to that. So I want to talk to the UK and the US. There's some parallels going on right now. Just a couple of weeks ago, we had an expert on the digital ID that DHS Secretary Kristi Noem has been telling people to switch over to. That switchover happened in late May. That was kind of the deadline, at least for air travel here. The UK has their own conversation and their own switchover happening right now. If you go over to Reclaim the Net, they've been looking at a lot of these digital conversations. "The UK's Digital ID era starts this summer." It says, "Beginning with a digital version of the Veteran card and expanding to include driving licenses later this year," --this is where it's different than the US-- "the initiative is designed to eventually consolidate all government-issued credentials into a single, centralized app by 2027." So everything is going to be on your phone. In the US, obviously, we still have a card, a digital ID card. The UK is saying we want it all digital. Remember, that was the COVID vaccine passport. That was the trial run for this. And luckily in the UK there's a lot of citizen groups, nonprofit groups that are standing up fighting for this, trying to get some safeguards in place. One of them is Big Brother Watch, and they had this to say.

[00:34:48] Jasleen Chaggar, Legal & Policy Offer, Big Brother Watch, May 31, 2025

Hackers now hold huge amounts of personal information about UK citizens after recent cyber attacks. This should be an eye-opener to the government plowing ahead with plans to create a giant database state by producing digital ID systems. This new government app will hold a digitized version of our driver's license and masses of information on each of us drawn from multiple departments.

[00:35:08] Peter Kyle MP, DSIT Secretary

We will launch the digital driving license and it will go into people's wallets, digital wallets.

[00:35:14] Jasleen Chaggar, Legal & Policy Offer, Big Brother Watch, May 31, 2025

A digital ID could easily include details such as every time you've seen your GP and your tax returns. This would create a honeypot for hackers and foreign adversaries who, like we've seen with the recent cyber attacks, already have a track record of trying to breach databases. Digital IDs would also exclude thousands of Britons experiencing digital poverty from being able to access basic government services. We're being sold digital IDs in the name of convenience, but they come at an enormous cost to privacy, equality, and freedom. That's why we're fighting to give you the right to say no to digital ID.

[00:35:46] Del Bigtree, Host, TheHighWire.com

Well, thank God someone's fighting. But I mean, the idea, we think about a digital ID in America, but an international digital ID where we're being tracked everywhere by everything is about the most horrifying thing you can imagine.

[00:36:00] Jefferey Jaxen, Investigative Journalist

And as they mention there, it's not just the government you have to worry about centralizing all that information, because we saw how the government acted during COVID, where they were punishing people for their views and their informed consent when it comes to medical, medical devices or vaccinations. But it's also, like they said, hackers. It's a treasure trove for hackers. So there's another organization called Together UK, a nonprofit organization. They actually put out a digital bill of rights, and they're trying to get this adopted and put this in before this switchover happens, and it's actually a very intricate bill. I'm going to go over some of the articles here, but they're basically, article one is saying they want people to have the right to choose offline or digital options. So just basically right to choose. They want privacy and data protection, obviously. They want financial freedom, because this is going to, this is going to link to your bank account and all your purchases. And they want obviously protection from surveillance, because that goes into our next headline here. Because what the UK is also doing in parallel is building out facial recognition systems that are akin really to what's happening or what has happened in China, and this is the Ada Lovelace Institute.

[00:37:04] Jefferey Jaxen, Investigative Journalist

And they looked at this rollout, and they say this. "Mass facial recognition roll-out exists in 'legal grey area' due to inadequate governance." So there's not really these checks and balances, and the government is racing to put these facial recognition cameras up. And the final, the final headline here, the UK police, because they're going to be utilizing it mostly, are asking for more funds, hundreds of millions of pounds to expand facial recognition use. So they're running full speed ahead for this. The checks and balances aren't there, it's a legal gray area, and there's, the government is saying we want everyone aggressively to switch over to an app on your phone. I don't see this ending well, if it's not, if it's not stood up against and changed. And thank God there's people in the UK and the world right now with eyes on this, that don't want this, don't want this to happen the way it's going down.

[00:37:56] Del Bigtree, Host, TheHighWire.com

Yeah. Yeah, it's really horrifying stuff there and it's, you know, it's what's on our horizon. And you put the facial recognition software with all the AI conversations, computer systems tracking everywhere we're going, you know, it really doesn't look good. You know, we're going to be talking about a lot of these issues next week, Jefferey. You and I, the whole HighWire team, is heading off to FreedomFest. For those of you that haven't been to FreedomFest, this is definitely one of my favorite conferences of the year. I guess I call it like a libertarian conference. It's going to be in Palm Springs, so it should be beautiful. We're obviously going to be broadcasting live right in the middle of it there on Thursday. But also I have multiple speaking events. Aaron Siri is going to be doing speaking events, and you're going to be doing like a whole live feed that people can watch here on The HighWire live from FreedomFest Friday, June 13th on The HighWire. So that should be fun. It's going to be like, I know you're always doing these interviews. Now you're just going to go live and just grab all these people that are walking by, all the speakers. What are you looking forward to there?

[00:39:05] Jefferey Jaxen, Investigative Journalist

Well, I just, looking at the diverse ideas that people have there. FreedomFest is kind of an incubator for. Well, they would be called libertarian ideas, but these libertarian ideas are now really mainstream so there's a lot of really interesting conversations there, we're just going to broadcast that live. So we're going to try something a little new next Friday, so tune in to The HighWire on the socials so you'll be able to see that. And also our show on Thursday, that's going to be huge.

[00:39:27] Del Bigtree, Host, TheHighWire.com

All right. Excellent. This Sunday we're finally dropping the latest episode of Jefferey Jaxen i=Investigates. The Rush to Green Energy. This is a, I think a really huge story. Tell me a little bit about that.

[00:39:41] Jefferey Jaxen, Investigative Journalist

Yeah. So this is the third installment of this. So we had polio first, mental health, and then now the rush to green energy. This is part one of two parts. It's a really expanded documentary. And we tackle the entire climate conversation from the science all the way to what's happening in the United States with policy, with actual mining, with the switchover, the aggressive switchover to net zero energy. Cover it all. And been working on this for a year, on this episode specifically. I'm really excited about it. I hope everyone goes and takes a look. Thanks.

[00:40:12] Del Bigtree, Host, TheHighWire.com

All right. Awesome, Jefferey. I'll see you next week in California live. I love doing the show, sitting with you right on the stage. It's a really different experience and people can be live in the audience with such a rare opportunity. Do we have the trailer ready to go to see Jefferey Jaxen Investigates? Let's take a look at this.

[00:40:31] BBC News reporter

Climate change.

[00:40:32] Various news reporters

Climate change.

[00:40:32] John Oliver

Climate change.

[00:40:33] Various news reporters

Climate change.

[00:40:34] Various news reporters

Climate change, and a media war over that crisis.

[00:40:37] Jefferey Jaxen, Investigative Journalist

What we're talking about here is really the climate conversation that's dominated science and the conversation in society for decades.

[00:40:44] Rush to Green Energy speaker 1

Well, the climate has varied over billions of years, sometimes huge.

[00:40:49] Jefferey Jaxen, Investigative Journalist

How has the climate changed before humans started industry?

[00:40:53] Rush to Green Energy speaker 1

Ice ages come and go. We've seen a lot of variation in the climate.

[00:40:59] Jefferey Jaxen, Investigative Journalist

Dangerous, human-caused climate change. That's what the UN is focusing on.

[00:41:02] Rush to Green Energy speaker 1

Dangerous is a human value judgment.

[00:41:05] PBS News reporter

The push towards a green, battery-powered future comes with a major trade-off.

[00:41:10] Fox News reporter

It's the left's electric vehicle hype real?

[00:41:13] Jefferey Jaxen, Investigative Journalist

I thought climate change wasn't political.

[00:41:15] Rush to Green Energy speaker 1

In your dreams. It's been political right from the start.

[00:41:19] Jefferey Jaxen, Investigative Journalist

Where does the electric car fall into this?

[00:41:21] Rush to Green Energy speaker 2

There is no greater source of carbon in our society than from combustion engine sources.

[00:41:27] Jefferey Jaxen, Investigative Journalist

Looking at headlines, I'm seeing the word the white gold rush. This is lithium.

[00:41:31] Rush to Green Energy speaker 3

What we've always kind of heard is that we need the minerals and we need them now. You can file a claim on public land anywhere. And you have the right under the mining law to work that claim.

[00:41:41] Rush to Green Energy speaker 2

We have done this project right, and not everybody agrees that we've done it right.

[00:41:45] Rush to Green Energy speaker 3

The problem is, is that any kind of extraction is enormously damaging to the environment.

[00:41:50] Rush to Green Energy speaker 4

Regardless of whatever people say, there are sacred sites that are out there. One day our Mother Earth is going to say enough is enough.

[00:42:09] Del Bigtree, Host, TheHighWire.com

So that's available to everyone that donates to The HighWire and ICAN. The HighWire+ is our way to give back. We've made these series especially for you out there and your commitment to the great work that we're doing. Because remember, not only are you watching these brilliant shows, you're helping fund all of our legal cases, and we're bringing legal cases all across this country. We are working on freeing the four right now. We're hoping to have some breaking news. I mean, every day I get up, I think this could be the day that we find out that another one of these states has gone down. It's all very exciting, and it's only made possible because of those of you that are out there and that you donate. I say at the top of every one of these shows, we do not have sponsors. We are not working for, we're not even working for a vitamin company or a water filtration company. Because no matter what, they will want to have some opinion on what you want to report on. We'd love to keep it where we are just funded by you, your sponsors. This is one of the only shows like it. When you think about it, what other news program do you watch, do you donate, and then do you watch them fight and go to court on the very issues that we were just complaining about? I never wanted to have a show where all we do is just point out the problems.

[00:43:26] Del Bigtree, Host, TheHighWire.com

I want to do something about it. That's how we're wired, and that's what makes The HighWire so exciting. All the lawsuit wins we've had against the government of the United States, FDA, NIH, CDC, HHS. We would not be here in this climate. I do not believe you have, you know, nine out of ten NHS workers denying the flu shot, or 85% of healthcare workers in America saying no can do on the COVID vaccine, if we hadn't been at the center of this, winning lawsuits, building this audience so that when COVID hit, we were able to really make a difference. Well look, we know there's other battles ahead, we've got to be prepared for them. We're building a community and we need your help to do that. So please, become a recurring donor today. Just go to the top of the page, thehighwire.com, hit to Donate to ICAN. It really is making a difference. Don't just think, oh my \$1 won't matter. It really does. If every one of you out there thinking I don't matter just turn to, you know what, it does matter, we can change the world.

[00:44:27] Del Bigtree, Host, TheHighWire.com

We're asking for \$25 a month. We think it's your most important donation. It's tax deductible. You get it, you know, you can take it off your taxes. We are a nonprofit. This is just an educational program for our nonprofit, the Informed Consent Action Network. We have a million ways that you can donate. You can do it by mail, by stock, international transfer, crypto, vehicles, gift card points, legacy giving. Also, we're working hard to really build up our social media right now, because we know so many of you, you know, well, and your friends, right, they have the short attention spans. And they're all over Instagram, they're all over Facebook. Well, so are we. And we're doing very special cuts now for those to help these things go viral. So you can follow The HighWire in all of those places you see. You can follow Jefferey Jaxen and you can follow me on X and Instagram, because it's all just a little bit different than what you're experiencing here and it might be exactly what your loved ones want to see. Of course, you can always watch our show on TheHighWire, Rumble.com, and my favorite right now, Roku and Apple TV. You can watch it right on your big screen television and see the quality with which, you know, we've been investing in all the equipment to make this show look the way it does.

[00:45:41] Del Bigtree, Host, TheHighWire.com

So for all of you that have donated, I want to thank you so much for that commitment. It really has made a difference. We've been a part of a real movement. And speaking of that movement, you know, what is the movement going to do? Are we prepared, should we start seeing some sort of a crazy authoritarian takeover? I mean, look, at some point it's going to happen again. You know it. There's political systems out there that really just believe in the power nanny state. And they want to bring it back to a theater near you. Will we be ready next time? Because I guarantee you, they're going to come prepared. They know what they got wrong last time. We have to know how to brace ourselves. We have to know how to nip these things in the bud before they happen. We've got to be ahead of the game. We've got to be communicating with each other. All of this is the core principles that are brought about in a beautiful way, weaved together in such a genius and exciting platform in the new documentary, The Agenda. Here's the trailer for that.

[00:46:47] Speaker 1, The Agenda

The lust to control other human beings is a story as old as time. There's a very strong drift in the direction of globalization, of the ultimate centralization of control in the hands of unelected officials at supranational organizations.

[00:47:03] Speaker 2, The Agenda

They want all of the resources of the world in their pocket.

[00:47:09] Speaker 3, The Agenda

The bigger picture is that an attempt is underway now to collapse liberal democracy and replace it with global technocracy.

[00:47:19] Catherine Austin Fitts, Former Assistant Secretary of Housing and Federal Housing Commissioner at the United States Department of Housing and Urban Development, Former Managing Director and Member of the Board of Directors of Dillon, Read & Co, Inc, President of Solari, Inc.

This is a coup. They're saying we can control with rules. We don't need currency anymore.

[00:47:25] Speaker 4, The Agenda

It's like an inverted prison. You are supposedly free to roam about, but everything you want to access is behind lock and key.

[00:47:34] Speaker 3, The Agenda

The potential for social control is gigantic and potentially irreversible.

[00:47:42] Speaker 5, The Agenda

They plan to commandeer land, reduce farming, and radically change the food we eat, transform the supply of electricity, and then dictate how we use it, and replace currency with a system of credits. All three strategies are built on the premise of a climate crisis caused by carbon dioxide.

[00:48:02] Speaker 6, The Agenda

I do not think there's a climate crisis, and I base that on all the evidence and the climate data sets that we build to answer questions just like that. The government is very clear that they want a catastrophic story.

[00:48:15] Speaker 7, The Agenda

There is no single science paper that proves conclusively that humans control all or most of the global climate.

[00:48:23] Speaker 8, The Agenda

Europe's mad dash towards net zero is effectively economic suicide. Politicians are purposely impoverishing ordinary people, purposely deindustrializing Europe.

[00:48:33] Speaker 7, The Agenda

It's just tremendous amount of damage in the name of saving the planet. It does make you ask what is it we're actually saving if we're paving it over?

[00:48:41] Speaker 9, The Agenda

I think what we're dealing with here is actually a global war on agriculture.

[00:48:46] Speaker 10, The Agenda

When you look at how many farms are selling up, we're walking into food shortages.

[00:48:50] Catherine Austin Fitts, Former Assistant Secretary of Housing and Federal Housing Commissioner at the United States Department of Housing and Urban Development, Former Managing Director and Member of the Board of Directors of Dillon, Read & Co, Inc, President of Solari, Inc.

If I can switch everybody from real food to pharma food, then 100% of the agriculture industry can go through my publicly traded stocks, and I have complete control.

[00:49:02] Speaker 11, The Agenda

This is the biggest public relations scam in the history of the world. But it's far more than that. It's a blueprint. It is the action plan.

[00:49:14] Speaker 2, The Agenda

All life on earth is going to be radically changed.

[00:49:18] Speaker 12, The Agenda

Everything will be monitored. The environmental consequences of every human action.

[00:49:23] Catherine Austin Fitts, Former Assistant Secretary of Housing and Federal Housing Commissioner at the United States Department of Housing and Urban Development, Former Managing Director and Member of the Board of Directors of Dillon, Read & Co, Inc, President of Solari, Inc.

The general population cannot fathom the psychopathy of the vision that they're facing.

[00:49:28] Speaker 4, The Agenda

Once the digital ID is in place, it's game over for humanity.

[00:49:39] Del Bigtree, Host, TheHighWire.com

Well, it's a powerful and beautifully made film that I think is incredibly important. I'm joined now by the producer of the film and British broadcasting legend, Mark Sharman. Mark, it's, it's good to see you again. Thank you for joining us.

[00:49:58] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Well, thank you for inviting me, Del. It's good to be back. I'm not sure about the legend. A legend in my own lunchtime, maybe.

[00:50:05] Del Bigtree, Host, TheHighWire.com

Well, I mean, you're the real deal. You call it like you see it. Back during COVID, you were speaking out against the media that you had had a career in. I feel a simpatico with you that way, having come from, you know, CBS and mainstream television. And I feel the simpatico with you now because, you know, a lot of people will say to me, Del, we have COVID fatigue. You know, we're over it, we're through it, it's in our rear view mirror. You know, can we talk about other things? And I know you've heard, I know you have to have heard the same thing yet you went out and made a documentary to say, this isn't over yet. They're still coming for us. You know, what's your perspective on that? Why make this film now?

[00:50:55] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Well, to quote Phil Wiseman, who's my film partner, you know, people think there's something wrong and if you think there's something wrong, you're right. And it really started with a researcher in the UK called Sandi Adams, who is a big follower and disciple of Rosa Koire. And we were disturbed to see her presentation about what was behind in the United Nations Agenda 2030 and the SDGs, the Sustainable Development Goals. And the more we dug into it, actually, the more awkward it became to understand. And so we sought out, you know, world experts and outspoken experts and put it together in the film. It's interesting watching Jefferey's piece earlier in the show, in that it covers a lot of the same ground in that there's a very large chapter on surveillance and AI and the tools that give, I mean, I think in that promo, the trailer you've just seen, you know, we say that the, the lust to control other human beings is as old as time. Well, of course, they now have the tools. They've got surveillance, they've got AI, they've got potential digital currency, and worst of all, digital IDs. And we covered that. And they are all elements of control. I mean, it's almost as though, I don't think people realize quite what the future holds in this regard. It's almost as though someone asks you to fill in a piece of paper and write down every single aspect of your life, not just your finance and your health and your driving license, but all kinds of personal, intimate details, and then just handing it out to the public.

[00:52:48] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

And that's basically what this digital database, which has been talked about in the States as well as in the UK, it basically takes away individuality, it takes away privacy, and, as I think we say in the film, it's the end of humanity as we know it. It's, it's hard to convince people it's coming and yet if you look at all the things that are going on in the world, it's pretty clear that this plan is quite well advanced. It may not be a cohesive plan, but the dreams of those who would have us under control are definitely moving forward. So our film covers surveillance, it covers health through the W.H.O., it looks at how big business has really infiltrated these supranational organizations. And, you know, they're not elected, Del, but they're making, they're having influence over everyday lives of everyday people. But we also look at climate change, and we look at net zero, and we look at farming, and also education, because the education system, certainly in the UK, is geared towards the same goals and children. You know, we now have a very large population of children that have now, some of them are teenagers and some some of them are adults, who have been indoctrinated to this way of thinking. Yeah, it's, we cover a lot of ground in it, but quite a lot of what Jefferey was talking about, surveillance and climate change and the way climate change is being used to influence world policy.

[00:54:27] Del Bigtree, Host, TheHighWire.com

You know, it's really, I find it fascinating that, you know, when you meet someone and I've had the opportunity to meet you when I was in England, of course we had you on the show during COVID, but you meet people that you recognize think the same way you do, that their brains work the same way, they have the same level of skepticism. And when I look at what's in your film, and as you pointed out, just sort of, you know, at the same moment Jefferey Jaxen is investigating a part of that film, which is, you know, this global warming, this use of global warming to bring in these authoritarian regimes. And in some ways, you know, I know that the research we're doing is always at a top notch. But when you see people on the, you know, across the ocean, living in a different country but asking the same questions, coming to many of the exact same conclusions, it really is. It's sort of that, you know, science when it repeats itself, when journalists repeat themselves, when they look clearly and ask the same questions and they're getting the same results, you realize you are really on to something. You know, what is the climate in Europe right now? Do you feel like a large enough percentage of people are questioning these surveillance systems that are being put in, when they're walking by and seeing a camera being put in on a light post, or they see the news talking about a new digital tracking system for their phone, you know? Do you feel like you're going to win this over in Europe right now?

[00:56:04] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

I don't think there's anything like enough recognition. I mean, bear in mind that this, I think, again, we say in the film, the spread of these digital devices are sold as safety, of convenience, of help, and of course entertainment. And people are sucked into it without realizing. There's an analogy that a fellow called Ivor Cummins gave in the film where he says, it's like a drug, you know. You ply people with the harmless stuff and you get them involved in it. It's very, it's fun to do, and you get more and more into it, and then suddenly they give you the hard stuff and you're trapped. And that's exactly what's happening, in my view, with digital technology. And people think it's all good fun and they think it's of a convenience. But, I mean, the UK is bristling with cameras. It's unbelievable. You know, even in the small towns and villages, there are cameras everywhere. And they sell it as being for your safety and to help traffic management and whatever. But they're everywhere, I mean, everywhere. You cannot walk down a street without the cameras looking at you.

[00:57:17] Del Bigtree, Host, TheHighWire.com

You know and it's, one of the more chilling parts of your film deal with exactly that. It's something called Zero Trust. I want to play this clip for you, take a look at this.

[00:57:31] Speaker 5, The Agenda

We've been drawn into this digital spy network in the name of convenience, connectivity, safety, and especially entertainment. The 3D world of cyberspace creates virtual lives that are often more exciting than reality.

[00:57:48] Speaker 4, The Agenda

Why is this technology being developed? It's all for the culmination of this digital prison from which there will be no escape after all the switches are turned on.

[00:57:59] Speaker 5, The Agenda

The critical switch would be the introduction of those digital IDs and central bank financial control. A world of zero trust.

[00:58:09] Speaker 13, The Agenda

Zero Trust is based on a simple principle. Never trust. Always verify.

[00:58:14] Speaker 4, The Agenda

Zero Trust is a protocol that is implemented by cybersecurity companies. And what it really means is, we don't trust you and you have to prove who you are all the time, 24/7. So think of it as going from a world of implicit allow to default deny. In tomorrow's world, once Zero Trust is implemented in, say, retail, everything will be behind Plexiglas doors with a 3D camera, and it will only be unlocked through your digital identity and facial recognition if you have the available carbon credits in your digital currency.

[00:58:55] Speaker 5, The Agenda

If you've reached the limit of your allowance, it could be access denied. This would apply to fuel, to travel, to meat and dairy products, to clothes, and other consumer goods. Because everything in life could be valued by its carbon footprint. Even access to the internet could be denied.

[00:59:19] Speaker 4, The Agenda

So the new world of Zero Trust is really a world of locks. It's like an inverted prison. You are supposedly free to roam about, but everything you want to access is behind lock and key.

[00:59:35] Del Bigtree, Host, TheHighWire.com

You know, I've really been, you know, grappling with this reverse prison or however he describes it, because, you know, we've got self-driving cars that are just now entering the roads here in America, big conversation. I think Tesla is releasing a car any second. Then all of a sudden we have self-driving cars so no one can speed. And and you have this question mark. You know, I remember, over the years I've had people ask me, what is your problem, Del? If you're not breaking the law, why do you care if there's a camera watching you? What do you say to someone that's like, I mean, do you need to be able to break the law to be happy, do you need to be able to speed your car to be happy? Why does surveillance matter if we, you know. Do we need to have the right to break rules?

[01:00:30] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Look, everybody has got something that they would prefer the rest of the world not to know, number one. But it's not just about watching us and using our details. You can then move into the persuasive state. And I'm quoting Klaus Schwab actually here, but you can move into the persuasive state, where through subtle advertising and psychology, they can really begin to control and push, what you're going to buy, or how you're going to think. The next stage is what Klaus Schwab has called the predictive stage. And he actually says there'll be no need for elections anymore because we know how you're going to vote. Now that's a really dangerous statement. They're saying we don't need to ask you anything because we can tell you. It's predictable, it's prescriptive, which means we're going to tell you how to vote, how to live your life, how to spend your money. You know, who knows whether this will come to fruition. But it could, and that's the, that's why we need to speak up now and say, hang on a minute. This is not just about entertainment. It's not just about your safety. It's not just about catching crooks on the street.

[01:01:44] Del Bigtree, Host, TheHighWire.com

Do you have a...

[01:01:46] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

By the way, that gentleman who....

[01:01:47] Del Bigtree, Host, TheHighWire.com

Yeah.

[01:01:47] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Sorry, by the way, that gentleman describing that is the man called Aman Jabbi, who's a very clever scientist who used to work in Silicon Valley. He got out, I think, when he saw the direction of travel.

[01:01:58] Del Bigtree, Host, TheHighWire.com

Yeah. I mean, we've watched many of these designers of AI run out of buildings with their hands in the air and just say, I'm sorry. I'm sorry for what I've done. It's quite chilling. You know, people saying we're not going to be able to stop it, we've made critical mistakes. And that's just a part of this, right? I mean, AI, what is, you know, what capability does it have if we're not all holding something that we're controlled by. When you just personally look at this issue, do you have like a timeline in your head? I know I keep just thinking. You know, people say to me, you know, if you could take a time capsule, you know, 50 years ahead, what do you think you'd see? I keep saying, I don't want to go 50 years ahead. I'm more interested in like five years, maybe ten years, because I think it's either happened or it hasn't. You know, I think that that's where you're going to see whether this thing took hold or not. Do you have a sense, do you have a ticking clock when you're involved in this conversation and working on a project like this?

[01:03:01] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Well, at the speed of change and the speed of development is astonishing. So, you know, Agenda 2030 is just that, they want things done by 2030. I mean, they want, they're not going to achieve all of that. But the pressure is really on.

[01:03:15] Del Bigtree, Host, TheHighWire.com

That's right. That's a pretty specific date. You know, you're right. 2030. I keep saying, right, take them for their word. We're talking five years away, they want, you know, global control.

[01:03:27] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Yeah. Well, so I mean it's, you know, in my lifetime, the speed of change is just got faster and faster and faster and, no, I think ten years time, we will hardly recognize where we live.

[01:03:41] Del Bigtree, Host, TheHighWire.com

Yeah. One, another part of the film. Go ahead. Yeah.

[01:03:46] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Sorry. The great irony is, of course, that lots of the world policies are based on climate change and about saving the world and about carbon emissions and greenhouse gases, and particularly in the UK, we are going hell bent on destroying every kind of traditional power source, and going for solar panels and wind turbines. I mean, we're destroying the countryside with these things. I mean, it's great irony, you know, in a country that doesn't get much sunshine. But the great irony is, the great irony of this push towards surveillance and electric cars and electric this and electric that is going to require vast amounts more power than we've got at the moment, and the natural, the wind turbines and the battery-powered and the solar panels, they cannot match demand at the moment. And yet we're going to need, you know, ten times that if we're going to wipe out. I mean, Larry Fink, the Blackrock chief executive, has said himself that intent in, I think by 2030, he says that surveillance and AI and all the backup that's required is going to use the same amount of power, sorry, 30 times the power, 30 times the power of an average city. And he says, where is that power coming from? We haven't made those plans. I mean, the whole United Nations Agenda 2030 and this push to net zero is full of contradictions. You know, one thing works against another. They talk about, actually, I think you're going to go into farming in a minute, but they talk about the environment and the land and whatever. And at the same time, they're covering over with solar panels and wind turbines. It's, uh, it's bizarre.

[01:05:37] Del Bigtree, Host, TheHighWire.com

It is. It is really bizarre. And to think, you know, we're all being starved to death. We are, you know, not able to run heat pumps during the winter, they're taking more and more energy away from us. You know, you're trying to get us blocked into 15-minute cities, ten-minute cities, five-minute cities so that we can't go anywhere. Meanwhile, you know, somewhere between 50 to 90% of all energy is going to be, you know, need to be created for this great controlling computer mind that they're building. So I frankly feel like, why save any gas right now? I need to power up, I need to, you know, protect myself, I got to build a fortress to be able to block this insanity. So, you know, I'm not into this whatsoever. And the worst part of it is what they're planning on doing to our food, or what they think might be food. You have almost a grotesque section of the film talking about, you know, pharma's involvement in food. Let's take a look at that.

[01:06:39] Catherine Austin Fitts, Former Assistant Secretary of Housing and Federal Housing Commissioner at the United States Department of Housing and Urban Development, Former Managing Director and Member of the Board of Directors of Dillon, Read & Co, Inc, President of Solari, Inc.

It's basically a pharmaceutical industry taking over the food supply. If I can switch everybody from real food to pharma food, then 100% of the agriculture industry can go through my publicly traded stocks, and I have complete control. So the idea is we get rid of farmers, we kill any naturally grown food, and we engineer food in manufacturing plants and laboratories. But I assure you that those guys are not eating this.

[01:07:07] Speaker 5, The Agenda

Bill Gates is one of the familiar corporate faces, and he's investing heavily in the food revolution under the guise of avoiding climate disaster.

[01:07:17] Bill Gates

Cows alone account for about 6% of global emissions. So we need to change cows.

[01:07:27] Speaker 5, The Agenda

And while he talks up the perceived problem, Gates is pouring money into the supposed solution: artificial meat and genetically modified crops. Crucially, anything that is invented or altered can be patented.

[01:07:42] Speaker 9, The Agenda

The core of his agenda is he wants to do in agriculture and pharmaceuticals, by the way, what he did in the computer world. True power, massive, incalculable wealth comes from owning intellectual property and then monopolizing it. They want to make it so that every single organism that is used for food is ultimately under their control, either through the 3D printing or through this genetic manipulation. So we're moving now very rapidly toward this totally centralized food system, where a tiny handful of corporate interests in bed with totalitarian government will dominate the food supply so that there is only a giant public-private partnership with total control of all food, all energy, and I believe water will be next.

[01:08:30] Del Bigtree, Host, TheHighWire.com

You know, he ends with the water and I think about the fact that the new head of the WEF is, you know, been caught saying, you know, that water is not a human right. And, you know, and you see these images of, you know, you can't get through the glass until you get the face recognition software. Is there a moment where they say, you drank your allotment of water this week, or you don't have the carbon credits that delivered the water here today, so therefore you can't drink water? I mean, it seems implausible, but we went through COVID and we saw how quickly our government will go absolutely bonkers.

[01:09:10] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Well, I mean, you could view it and I think I do view it that the response to COVID certainly was a test in how far they could control us and push us. It was a, the psychology involved was terrifying. I mean, they used the masks, which everybody knew didn't work. They used the mask as a kind of badge of compliance. And to change the world order, and I do believe they're trying eventually to change the world financial system away from fiat currency and move towards a natural asset based financial system. Um, I've lost my thread there. To do it, to move away from that, you need people to comply and you need a big story. And COVID was a story. Climate change is a much bigger story. And they cut, they, you can't separate or won't separate or they won't uncouple finance from climate change, and Mark Carney, I've noticed in Canada, you know, Mark Carney has been advocating a change in the financial system for a while. He's now, and at the same time, he's a special envoy to the United Nations for climate change and finance. Now, it has to be a conflict of interest. If you're trying to change the financial system to one based on natural resources, you know, should you really be then advising on climate change as well? And he's backed that up with new statements in Canada since he took over as prime minister.

[01:10:55] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

He's saying again that companies who are part of the problem, you know, will not get financial backing. So I, personally I think you've got to do two things. If you recognize that climate change is the big story that we all have to believe, and it's the new religion, and you have to go along with it, first of all, you've got to separate it from finance and be perfectly, distinguish it because, you know, all the financial people getting involved in green energy and green everything to save the world, are either using climate change to change the financial system, and I tend to be quite cynical. But then I think you need to uncouple it much more, the financial operation and the climate change. But also we need a proper debate on climate change. I mean, you know, it's been the narrative of man-made climate change through CO2 and other greenhouse gases, it's been locked into the psyche for 40, 50 years, and pretty well all grants from the, that have gone for research have gone into man-made climate change. It's very hard to get your voice heard or get any financial backing, to do, to work on any alternative reason. I mean, we talked to Professor Christy in the film, he's a very distinguished climate professor. And he says, you know, the climate is rising by about 1.5%, but it's perfectly natural. And if you look back over time, the changes are very much in line with what we've seen before.

[01:12:41] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

And in fact, we're still a lot cooler than we were a few thousand years ago, we are still coming out of an ice age. But, you know, it's also, the media are, you know, I spent my life in mainstream media, and that's a huge disappointment to me in that, you know, corporately and individually everybody buys the same story and, conflicting arguments basically aren't allowed. Nobody asks the right questions and nobody says, hang on a minute. There must be other reasons for for the changing climate. It's carbon dioxide. And by the way, without carbon dioxide, everything dies. You know, you have market gardeners here and probably in America, that pump carbon dioxide into their greenhouses to make the plants grow better, and even NASA, even NASA is saying that, you know, over the past few years, the world is greener because of carbon dioxide. It's not necessarily a bad thing at all, even if it is causing, being caused, sorry, even if it is causing climate change, which is, should be debated because there's plenty of evidence to the contrary. And it isn't, it isn't right and it's not. in a free debate, you know, we should be looking at all sides of the story to really determine what the truth is. And, you know, it's too easy to use climate change, as I say, as a religion that must be followed and then use it to implement all kinds of different agendas.

[01:14:11] Del Bigtree, Host, TheHighWire.com

Well, and we're letting it be too easy because we're not asking the right questions, media is not asking the right questions. I mean, for instance, if, you know, global warming is happening, climate change is real and is being caused by mankind, then I would say moratorium on any new advancement that is going to increase our energy usage by 30 times. So how about moratorium on all AI if we're going to all just say that, you know, climate change is real. And, you know, I mean, so just things like that that make absolutely no sense whatsoever. And also, you know, if CO2 grows things, I mean, just, these things don't add up, they don't make sense. And, you know, when you look back now at your career, Mark, why you got into media, why you got into television, you know, what has that journey been like as you reflect now? And were you always skeptical, or was there a moment where you started saying, wait, hold on a second. This isn't media anymore. This isn't news anymore. This is, we're a part of a propaganda agenda. Did you ever come to that conclusion? Did you always feel like that was the case? What was the turning point?

[01:15:28] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Well, no, I didn't. I mean, listen, as you well know, there's always been a relationship between governments and media and sometimes, you know, we know the system of briefing, we know the system of lobbying, and you get how it works. However, throughout my career, we always saw ourselves as the ones to hold officialdom, governments, councils, politicians, hold them to account, you know, and ask the questions and drive the stories. That's just disappeared. You see so little investigative journalism now, apart from, you know, the excellent work that you do and your station, and a lot of independent media. But of course, you do it in full, full-blown, top-quality broadcast style, which we've tried to do with this film as well, because, you know, we want the messages to look as though it's important and real. But no, I don't know. Listen, I can understand individual journalists, particularly with COVID, who couldn't, weren't allowed to speak up, actually, but couldn't speak up because they've got mortgages to pay and kids to feed and everything else. Same with the medical profession. But there reaches a point where editors or someone should say, enough's enough, and we must start asking these questions. And of course, as you well know, when one broadcast or media organization starts to open the door, the rest are quite happy to trip on through it. But who's leading the question? Who's leading the questions? You know, it should not be left, with all due respect, to you and The HighWire, brilliant as it is.

[01:17:08] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

You know, it should be in mainstream. But mainstream. I mean, certainly from what I see in the States has been bought and paid for a long time ago. And unfortunately, it's happened here. I mean, we're trapped between a media that's full of tripe, you know, stupid showbiz stories and footballers' wives and that kind of thing, and propaganda, you know, and especially climate change. I mean, you try to tell anybody that these fires, floods, droughts are not climate change, when in fact, according to our film and according to the experts, they're actually more or less the same as they've ever been. But the media, the media won't, you won't question it, and you see them, I think, as Jefferey's clip there, you have media saying all the time, you know, climate change is real, climate change is responsible. This is, this fire is, you know, a result of climate change. We must get it and we must change. But yeah, it's very disappointing for me, you know, who started out in the old school of journalism where, you know, I mean, I remember being warned off never to accept money if somebody came to you after a court case because to keep it out of the paper. You know, we were the champions of free speech and the champions of truth and the champions of, as I said before, holding governments to account. I don't see that now, as I'm sure you don't either.

[01:18:37] Del Bigtree, Host, TheHighWire.com

Yeah. Well look, this is a brilliant film. It's made by Oracle Films, out there in the UK, who I've had the opportunity to work with. We've worked with them through The HighWire when we need some things done out in England. It is a beautiful film. It's a powerful film. And, I guess in order to watch it, we go to theagendafilm.com, is that where we're able to watch it right now?

[01:19:04] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Yes. It's, at the moment, it's still on YouTube.

[01:19:07] Del Bigtree, Host, TheHighWire.com

Okay.

[01:19:08] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

So hopefully it's, it'll get a wider audience there. Have I got time to say one more thing?

[01:19:14] Del Bigtree, Host, TheHighWire.com

Okay. Yeah.

[01:19:15] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

When we work in our area, I don't know if you find it as well, but it's quite astonishing to, when you put out a film that's of quality and clearly has cost some money to make, people are starting to troll us and say we must be paid for, you know, we must be on the other side, we must be shills. It's quite, quite bizarre. How, you know. Anyway, there we are.

[01:19:40] Del Bigtree, Host, TheHighWire.com

Is there a place where people can get? Yeah. No, I agree, and that's one of the problems with higher quality production is for some reason it can make people skeptical. But you are still trying to fund this film, so where can people go to donate, to help make this film a success, and I know how expensive films are. Is there a donation page to get involved, or is all of that the same website?

[01:20:06] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

I think if you go to Oracle Films or if you go to theagendafilm.com, you'll find it there.

[01:20:14] Del Bigtree, Host, TheHighWire.com

Okay, and I'm being told by my producers right up there, oh top right, on the same page you can see, so if you go to theagendafilm.com, top right, you'll get to click on the ability to donate. Please, please, you know, make that happen, folks. And how was this funded, how were you able to get this film together?

[01:20:38] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

We had a amount of money put up front by a lady who was really concerned about the effect on schoolchildren and her children and, particularly the dumbing down of education. The fact that textbooks were all, and exams were all built around climate change and if you didn't go along with it, you wouldn't get the top mark. But particularly the transgendering and the sex education and the teaching of four-year-old kids about, you know, sexual preferences. She was very angry about that and asked us to help with the film. So she put some money up on an entirely personal basis, and the rest came from our pockets, actually.

[01:21:21] Del Bigtree, Host, TheHighWire.com

I know what that's like. Mark, thank you for your dedication, thank you for your career. Thank you for. I think, you know, it's a sign that we still believe in humanity, that you haven't, you know, built a bunker and gone and hide that you're still making movies, attempting to wake people up to what is really on the horizon. It's an honor and pleasure to know you, and I want to thank you for all the great work you continue to do.

[01:21:48] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Thank you. You should also thank Patricia Sharman, my wife, who is the driver behind a lot of this because I might have retired by now if it wasn't for her dedication and drive in it all.

[01:22:00] Del Bigtree, Host, TheHighWire.com

Yeah, well, good for you. You, you know, you just got me into some trouble because, you know, I need to thank my wife more often. We can't do it without those that, uh, that really make this all possible.

[01:22:12] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

It sounds like an Oscar speech.

[01:22:13] Del Bigtree, Host, TheHighWire.com

It does. Mark, I'm going to ask you a few more questions on Off the Record right after the show, so hang in there and we'll get into some fun questions, some personal questions. So I'll see you there. All right. Well.

[01:22:27] Mark Sharman, Producer, The Agenda: Their Vision, Your Future

Okay, thank you.

[01:22:28] Del Bigtree, Host, TheHighWire.com

Look, there's so many different ways that we can bring pressure, and then there's some people that are just, you know, born to bring the heat. This is Jillian Michaels, went viral this week. She's a good friend of mine. I worked with her when I was a producer on The Doctors television show. She's always called it like she sees it, and this time she got to say it right to Lee Zeldin. Take a look at this.

[01:22:54] Jillian Michaels, American Fitness Expert

I can always make a case, speaking of obesity, that people should take agency. Oh eat less and move more, and all of that works, if the food wasn't, of course, engineered to be as addictive, and we didn't have psychological vulnerabilities that were exploited by the toxic triad of ag, food, and pharma. However, even when I look at myself, knowing everything I know about food. I'm not at home, I'm away. I go to a coffee shop, I get my coffee, and I'm like, there's plastic in the lining of this paper cup and I just poured hot coffee into it, today and tomorrow and the next day. On top of, I'm at a hotel. Their products, the cleaning products, all that stuff, chemicals, chemicals, chemicals. And when I look at the reasons that I might have nodules on my thyroid, or I might have little white matter lesions on my brain, or, God forbid, I get cancer in the next ten years, I promise you it won't be a lack of exercise or eating salad. So it's the crap that you, to be fair, not to lay this at your feet, are solely responsible for, that I think is going to make the biggest difference, because the most responsible person cannot mitigate this toxic load in a significant enough way. It's in the water, it's in the air, it's in everything we package our food in. So I think it's just in this report. Is there anything that will facilitate your ability to remove some of that crap?

[01:24:18] Del Bigtree, Host, TheHighWire.com

Well, if you want to see the answer to that question, go check out Keeping It Real with Jillian Michaels. Good on you, Jillian. Way to bring the pressure, way to bring the truth, like only you can. You know, there's a lot of conversations going on this week. Some of them have come from my show last week, one of the videos went viral. And I want to make something clear. You know, I've seen statements, oh Del left MAHA, MAHA is dead. MAHA is a movement of the people, right. That's what it really is. And I think what's gotten it confused is this idea, sure. Bobby Kennedy can call something MAHA or Donald Trump can call it MAHA, but many of the people, you know, that make this or, you know, make this happen are just regular people, and that's what I wanted to get back to. I wanted to get back to we, the people of the United States of America and this movement. And there's debates right now, I think very important debates have been happening inside of this movement. Some people that are getting very, very demanding and clear on saying, why is there any COVID vaccine at all, Robert Kennedy Jr, with the writing is on the wall, the science is there. It exists. This is a horrific technology. It does not work. It shouldn't be promoted.

[01:25:37] Del Bigtree, Host, TheHighWire.com

It should be dead in the water and should have to go through multi-year, if not multi-generational studies to see if this is really affecting germline transfer. Is it inserting itself in the DNA? You're not going to get that even out of a double-blind placebo trial that lasts one year. And these are important questions to ask. And I also want to say that one of the beauties of a movement is the fact that it is as diverse as the nation that we live in, or the world that we live in. You know, when I think about the most successful, you know, movement, perhaps in America, I think of civil rights and, you know, I'll joke sometimes, you know, when we're dealing with infighting or people that are attacking each other, I always say, hey, you know, look, you know, we had Martin Luther King was assassinated, and so was Malcolm X over the infighting that was happening in the civil rights movement, and that's considered one of the most successful movements of our time. But can we learn, can we, you know, can we get better at this? Can we recognize that we all have our place to play here, that we need those extreme people that are just uncompromising, demanding, without any equivocation, we want change and we want it immediately.

[01:26:54] Del Bigtree, Host, TheHighWire.com

Then there's others that are like, hey, look, you know, Robert Kennedy Junior's only been in there just, you know, 120 days now or so, and look how much he's done. And obviously he's having to play chess. Obviously it's a puzzle in there that we don't get to see. And, you know, maybe we should have some faith. I find myself really, really right now grappling between these two spaces because we're running out of time. How much time does this administration have, you know? Of course, I got to work with Robert Kennedy Jr. so when I say people say, oh, he's compromised, I know that that's not the case. I know this guy is there to fight and will fight because this is what matters to him, and you don't spend 20 years on a topic getting dragged through the mud, only to let it go once you're finally in there. But maybe they're not playing the right kind of chess. Maybe Marty Makary needs us all to pressure and say, stop that vaccine right now. But what I want to say is, whatever position you're taking, also hold open that not everybody has to agree with you, that we all need to come at this from different sides, and we've got to love and care for each other and make sure that what we do not do is tear the movement apart.

[01:28:08] Del Bigtree, Host, TheHighWire.com

Let's not turn on each other. We all know we have, you know, common goals. We have common interests. We want safe food. I know we want clean food. I know that I see the people that say that Kellogg's, you know, Froot Loops didn't cause autism, but I think we all want cleaner food. I think we want to be able to, you know, trust when it says organic, it means organic. There's a lot that we want. And when we decide if we're going to attack, I also want to point out one of the concerns I have is what do you think Donald Trump's stomach is for all of this? If we start eating our own and attacking Robert Kennedy Jr as he's trying to get things done, is it possible that we could create such a distaste that Donald Trump says, I'm done with it, I'm moving on, and then the question I keep grappling with, is if not Robert Kennedy Jr, then who? And if not now, then when? I mean, certainly I'm recognizing that things are being achieved that we have never seen inside of HHS. Am I antsy, do I want more, do I want it faster? Absolutely. Am I in the mind, the pressure we are definitely pointing out on these shows the issues that are there. But I think that we have to recognize we have powerful voices.

[01:29:28] Del Bigtree, Host, TheHighWire.com

How we use them right now is going to be more important than ever. Mark Sherman is not alone, I am right there with him. There is a tidal wave of surveillance and authoritarianism that is coming, and we need to make these years right now as absolutely powerful and effective as we possibly can. But I also believe that as we demand more out of Robert Kennedy Jr, we should be demanding more of ourselves. Are we building the new system together? Are we building the new community that doesn't rely on the government to tell us whether or not a vaccine is available? Because I have news for you. Whether there was COVID or flu shots or any of it, my family's never gotten any of it. I don't care what gets approved by the CDC. I don't care what's approved by the FDA. They can shove it. It's not going in me and it's not going into my kids. So while we're at it, let's do our job to wake up everyone we know and say, whether or not Vinay Prasad thinks that it was a proper study, you could still turn this product down. You can still move to another state if the one that you're in is trying to force it on your children to go to school.

[01:30:41] Del Bigtree, Host, TheHighWire.com

We've got to resist every way we know is possible, and resisting doesn't just mean demanding more from our government. It means demanding more from ourselves. Stop going to doctors. Stop going to pediatricians if they use vaccines, and then praying that somehow they're not stupid enough to use the one that just got approved that you don't think was properly tested. Why are you there anyway? Get a chiropractor. Get a homeopath. Go to an acupuncturist. Change your diet, jog, love each other a little bit more. We've got to bring health into our own hands. That is the most powerful statement we can make right now. Let's build a community so big, and so powerful, and filled with so many physicians that will never give you a vaccine. Let's build that world together. While Robert Kennedy Jr tries to put together this puzzle in some form of 5D chess, we're not going to take our foot off the gas or even stop the pressure that's there. But even if he does everything we could dream, if the government is still our answer to health, we are effed. So get out there, meet some people, meet a chiropractor, start building a new community for our future so that when that tidal wave comes, we go boom. I didn't feel that. We're still here. I'll see you next week.
